APPENDICES

Appendix A	Land Use Changes – 2035 General Plan and Ravenswood Specific Plan
Appendix B	Sanitary Sewer Model Calibration Memorandum
Appendix C	Flow Demand Calculations
Appendix D	Model Outputs and Results
Appendix E	CIP Project Summary Sheets
Appendix F	Impact Fee Memorandum

ABBREVIATIONS

ADD	Average Day Demand
ADWF	Average Dry Weather Flow
CCTV	Closed Circuit Television
City	City of East Palo Alto
CIP	Capital Improvement Project
EDUs	Equivalent Dwelling Units
EPA	Environmental Protection Agency
EPASD	East Palo Alto Sanitary District
FAR	Floor Area Ratio
F&L	Freyer & Laureta, Inc.
ft	feet
FY	fiscal year
GIS	Geographical Information System
GPD	gallons per day
GPM	gallons per minute
HDPE	high density polyethylene
HGL	hydraulic grade line
I&I	Inflow and Infiltration
ISG	Individual Supply Guarantee
LAFco	Local Agency Formation Commission
LF	linear foot
MDD	maximum day demand
MGD	million gallons per day
O&M	Operation & Maintenance
OPPC	opinion of probable project cost
PDWF	Peak Dry Weather Flow
PWWF	Peak Wet Weather Flow
PHD	peak hour demand
PVC	polyvinyl chloride
RWQCP	Regional Water Quality Control Plant
SF	square feet
SRF	State Revolving Funds
SSOs	Sanitary Sewer Overflows
VCP	Vitrified Clay Pipe
WBSD	West Bay Sanitary District

ES EXECUTIVE SUMMARY

ES.1 Background and Introduction

The East Palo Alto Sanitation District (EPASD) was first established in 1939 in the southern corner of San Mateo County and borders Santa Clara County. Both the Cities of East Palo Alto portions of Menlo Park and are part of the EPASD's service area.

The purpose of this Master Plan was to re-establish the EPASD model in new software, provide an updated Capital Improvement Program (CIP) along with a rate and impact fee. This Master Plan is an update to EPASD's previously completed Master Plan in 2015 and its 2021 addendum.

ES.2 Land Uses

EPASD serves Cities of East Palo Alto and Menlo Park with a gravity-based sewer collection system covering approximately 1,230 acres (1.92 square miles) as shown in **Figure ES.1**. The system includes approximately 33 miles of sewer pipelines, primarily 6-inch vitrified clay pipes (VCP), with larger mains up to 30 inches in diameter. A major infrastructure component is the siphon under San Francisquito Creek, which was realigned in 2017 with two parallel 22-inch high-density polyethylene (HDPE) pipes. Downstream of the syphon, sewer system is conveyed to the Palo Alto Regional Water Quality Control Plant (RWQCP) for treatment.

EPASD operates and maintains the collection system in accordance with the requirements of the State Water Resources Control Board, as administered through the Statewide SSO Waste Discharge Requirements and RWQCB Sewer System Management Plan guidelines.

The City of East Palo Alto's 2035 General Plan, adopted in 2017, introduced land use changes to support balanced development across residential, commercial, and recreational uses. In 2024, the Ravenswood Specific Plan was adopted, which provided further refinement in the eastern portion of the city, enhancing details for mixed-use areas. These land use updates and other known developments were incorporated into system model. The land use maps are included in **Appendix A.**

ES.3 Sanitary Sewer Flow and System Analysis

Sewer flow estimates were derived using updated hydraulic modeling inputs, historic monitoring data, and land use assumptions. The methodology builds on the foundational work from the 2015 Master Plan and incorporates current Geographical Information System (GIS) data, flow monitoring studies, and zoning projections.

The flow projections for developments were calculated using a multi-step process based on billing records, zoning designations, and equivalent dwelling units (EDUs). Key elements of the process included:

- Estimating existing flows using 2019 billing data and a baseline of 200 gallons per EDU per day, consistent with WBSD practices.

- Projecting future flows using zoning densities and Floor Area Ratios (FAR) from the 2035 General Plan and Ravenswood Specific Plan.
- Based on 2011-2012 Sanitary Sewer Flow Monitoring Inflow/Infiltration Study by V&A Consulting (V&A Flow Monitoring), the peaking factors were applied to calculate peak wet weather flows (PWWF) from average dry weather flows (ADWF).

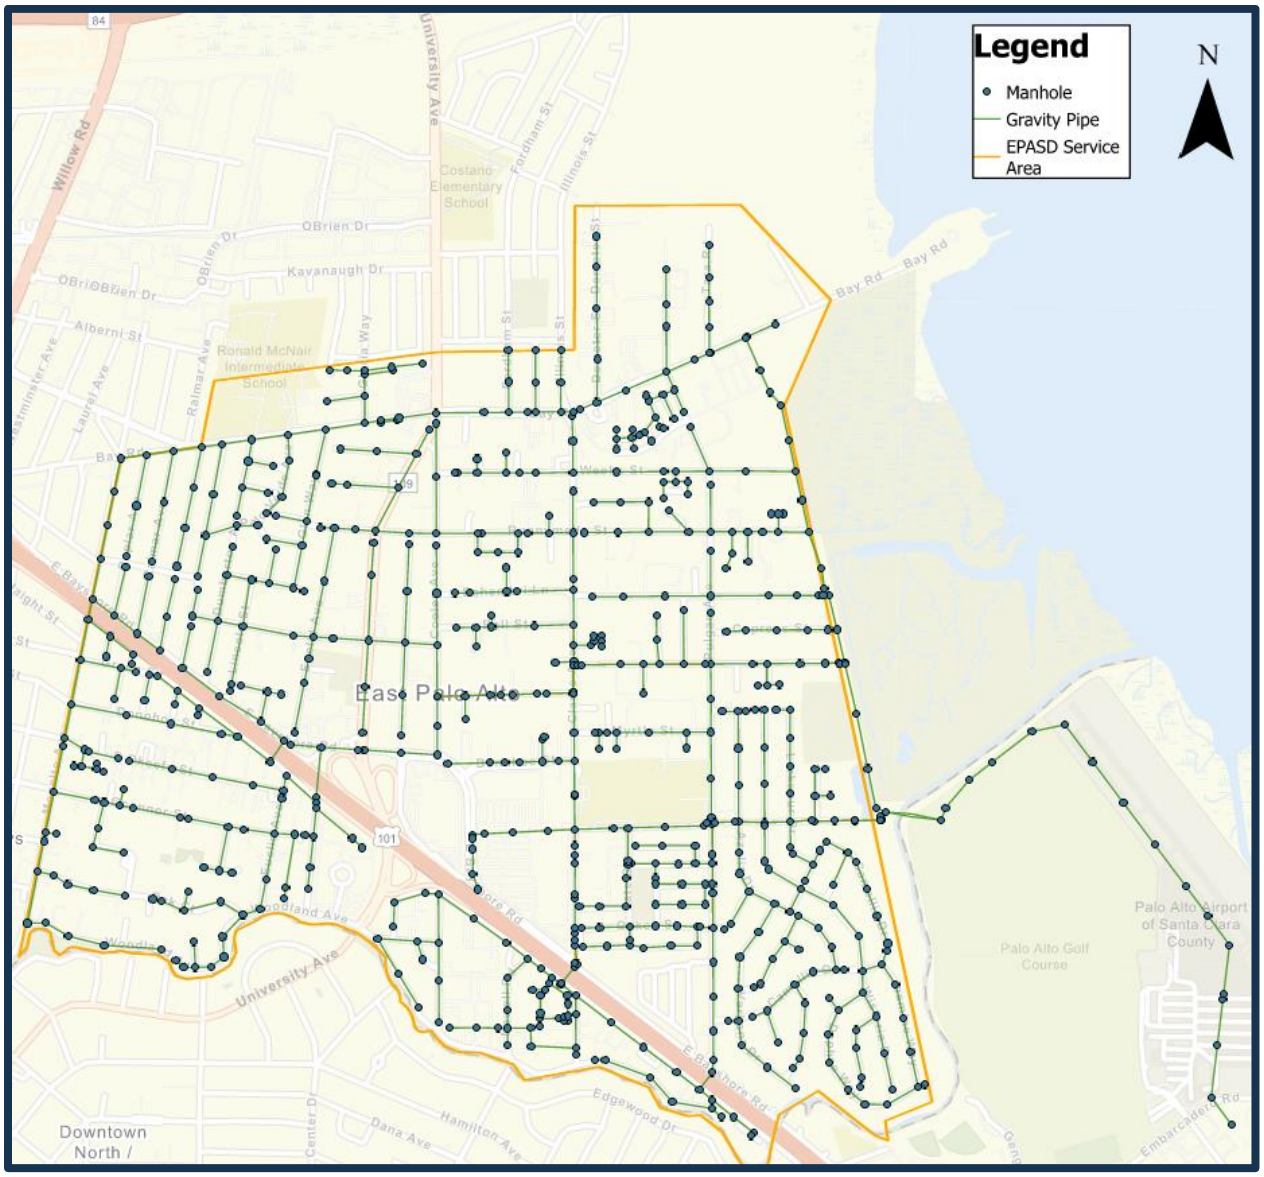

Figure ES.1 Existing Service Area

ES.4 Hydraulic Model Development

A hydraulic model was used to evaluate the current and future performance of the sewer system sewer system collection system. This model represents a tool used to support decision making for the ongoing improvement and maintenance of the system. The model incorporates physical and operational characteristics of the system and simulates key hydraulic parameters such as flow, velocity, depth, surcharge conditions, and hydraulic grade lines. The model was rebuilt from the outdated Hydra 7 platform to Bentley's SewerGEMS software. The new model was developed using EPASD's GIS database, archived field data, and updated infrastructure records. Validation against historical flow data confirmed the reliability of the SewerGEMS model, making it the analytical foundation for evaluating existing and future system capacity needs.

The three planning scenarios included the following:

- Scenario 1: 2025 Existing Conditions: The model was updated to reflect constructed developments and sewer improvements as of 2025. The projects included are Light Tree Apartments, University Plaza Phase 1, and 1950 Bay Road. The ADWF and PWWF were calculated and analyzed to assess the current system's capacity and identify deficiencies.
- Scenario 2: 2035 Conditions: Scenario 2 will be described as 2035 Conditions, which include the land use changes from the 2035 General Plan and Ravenswood Specific Plan.
- Scenario 3: 2035 Enhanced Conditions: Scenario 3 will be described as the 2035 Enhanced Conditions, which include the 2035 General Plan, Ravenswood Specific Plan, and Planned Developments. The planned developments include University Plaza Phase 2, Weeks Street Townhomes, and others.

This sanitary sewer system's performance was evaluated under wet weather conditions using a 10-year, 24-hour design storm, as defined by NOAA, to assess system capacity and predict sanitary sewer overflows (SSOs).

The 2025 Master Plan revises previous pipeline design criteria, replacing the depth-to-diameter (d/D) ratio with a freeboard-based standard. Under this updated criterion, all new or replacement pipelines are required to maintain a minimum of four feet of freeboard under design storm conditions. In instances where the pipe depth is less than four feet and the freeboard criterion cannot be applied, the system must demonstrate that no SSOs will occur under modeled conditions.

ES.5 Hydraulic Capacity Analysis Results

Hydraulic modeling was conducted for the three scenarios providing key insights into the current and future performance of the EPASD's sanitary sewer system (**Figures 5.1, 5.2,** and **5.3**). Based on the expected surcharge in current and future conditions, current and future capacity improvements are needed to accommodate peak wet weather flows.

Major observations within the model include:

- Modeled 2025 current conditions do not predict SSOs and surcharging exists in some areas exceeding the design criteria.
- Modeled 2035 Conditions and 2035 Enhanced Conditions experience SSOs with surcharging in some areas exceeding the design criteria.
- There are both existing customer and developer-related capacity improvements required
- The system has hydraulic limitations due to relatively flat existing topography, pipe slopes, and the absence of pump stations.
- Low flow velocities under both current and future dry weather conditions do not exceed 2 ft/s, which will require ongoing maintenance and monitoring.

ES.6 Pipeline Capacity and Condition Assessment

The recommended improvements for the sanitary sewer system have been grouped into four priority-based categories. These categories address both existing and future deficiencies related to hydraulic capacity, structural condition, and system longevity. A summary of each category is provided below, and results are provided in **Table ES.1** and mapping of categories 1-3 are presented in (**Figure 6.1** through **6.5**).

TABLE ES.1 PIPELINE CAPACITY AND CONDITION ASSESSMENT

Category	Description	Length (LF)	Running Total (LF)	Running Percentage of Total System[1]
1	Existing Hydraulic Deficiencies	7,285	7,285	4.2%
2	Future Hydraulic Deficiencies[2]	13,848	21,133	12.2%
3A	Structural Deficiencies	9,796	30,929	17.8%
3B	Remaining System nearing end of useful service life	142,928	173,857	100%

1. Total Pipe in System is 173,857 LF.
2, Excludes pipelines where developers and existing customers share responsibility.
Highlights: Category 1 and 3A deficiencies are grouped with the duties of current customers to fund improvements. Category 2 Improvements are developer related improvements. Category 3B lines represent ongoing maintenance needs by all customers.

ES.7 Capital Improvement Program

The CIP was developed based on the deficiency category classifications. Categories 1 and 3A represent the most urgent needs due to existing hydraulic and structural deficiencies. Category 2 projects address future capacity needs related to anticipated development and should be reviewed regularly in coordination with the EPASD as growth occurs. Where practical, structurally deficient pipes from Category 3A were incorporated into Category 1 or 2 projects to maximize efficiency and reduce construction overlap.

The CIP projects are broken down by Category, a summary can be seen in **Table ES.2**. Additional detail is found in **Tables 7.1** through **7.5** mapped out in **Figures 7.1** through **7.4**. A breakdown of each CIP project is found in **Appendix E**.

The project estimates should be evaluated alongside other infrastructure capital planning efforts within the City.

TABLE ES.2 CIP PROJECT SUMMARY

Category	Number of Projects	Pipe Replacement (LF)	OPPC ($)
1	2[1]	7,501	$17,357,000
2	7[1, 2]	17,000	$52,799,000
3A	4	6,429	$7,288,000

1. Portions of the project contain other category pipes to maximize construction efficiency. Work should be performed over the next 4 years funded by reserves and sewer service charges.
2. Principally developer-related projects.
3. The remaining portion of the sewer system 74% for existing VCP is suggested to be replaced over a 25-year period based on available funds. The OPPC for the remaining aging infrastructure will be approximately $4.3M/yr (6,000LF/yr), with an overall total of $107M. It is important to note that this cost is based on slip lining repair and partial replacement only.

ES.8 Rate and Impact Fee Study

As part of the EPASD's Master Plan update, a sewer service charge has been developed to support funding maintenance of the existing system. This rate is presently set at $660, and the addition of an annual increase of 5% be applied to the fund the extensive deferred maintenance in the system. Secondly, a revised impact fee has been developed to reflect newly identified CIP projects and current system capacity conditions. The proposed impact fee is $7,800 per EDU plus an annual 5% escalation, reduced from the previous fee of $10,621. The cost includes:

- Developer's Share of Capacity Assurance: 25 percent of the costs are associated with existing capacity assurance improvements that will benefit future developments.
- Developer's Improvement: 100 percent of the costs related to future capacity deficiencies based on new development demands.
- Buy-In Treatment Cost: A buy-in cost of $5 million per 1.0 million gallons per day (MGD) of treatment capacity.

1 Background and Introduction

1.1 Background and Project Objectives

The East Palo Alto Sanitary District (EPASD) was established in 1939 in response to the growing development in the East Palo Alto area. It was created under the Sanitary District Act of 1923 (Health and Safety Code Section 6400 et seq.), which allowed for the formation of special districts to provide sewer system collection and treatment services. Initially, the district's sewer lines were built as part of a Works Progress Administration (WPA) project during the New Deal era. Construction of these facilities began after a treatment agreement was reached with the City of Palo Alto in 1940, and EPASD's infrastructure was officially operational on September 8, 1942.

EPASD serves a portion of the cities of East Palo Alto and Menlo Park, in San Mateo County, and its sewer system collection system directs sewage to the Palo Alto Regional Water Quality Control Plant for treatment. The district historically operated as an independent special district, meaning it is governed separately from city governments. A five-member elected Board of Directors oversees its policies, while employees carry out daily operations.

As of October 1, 2024, EPASD became a subsidiary district of the City of East Palo Alto (City). The establishment of EPASD as a subsidiary district to the City was approved by the San Mateo Local Agency Formation Commission (LAFCo) on November 23, 2023, and finalized on September 16, 2024. LAFCo's approval of the subsidiary district recognized the need for improved transparency in EPASD governance and sustainable and efficient operation of EPASD.

The EPASD system includes the operation and maintenance of over 33 miles of sewer pipelines, ensuring sewer system collection for thousands of residents in its service area. As a subsidiary district of the City, EPASD will continue to operate with the City Council as the Board of Directors and the City Manager as General Manager. The City has contracted with West Bay Sanitary District (WBSD) for the day-to-day operations of EPASD.

The previous EPASD Sewer Master Plan, completed in 2015 and updated via addendum in 2021, now requires a full update. As EPASD is currently a subsidiary district, the City is initiating a new Sewer Master Plan to support a comprehensive Capital Improvement Program (CIP), including a timeline for implementation. The Master Plan update will:

- Identify areas of needed improvement within the existing sewer system as of 2025.
- Determine capacity upgrades required to serve future growth based on 2035 General Plan, the Ravenswood Specific Plan, and approved redevelopment projects.
- Confirm pipeline renewal and replacement identified by EPASD's prior condition assessment program.
- Develop potential CIP alternatives, including conceptual opinions of probable project cost and implementation timelines.

1.2 Summary of Existing Information

Existing documentation and data sources were thoroughly reviewed to support the development of the 2025 Master Plan. The reviewed materials provided critical background information and informed the development of key technical assumptions that served as the foundation for hydraulic modeling, capacity analysis, and the formulation of proposed capital improvement and operations plans.

Prior Studies, Documents, and Data

- EPASD Masterplan Update (March 2015)
- EPASD Masterplan Addendum (April 2021)
- 2011-2012 Sanitary Sewer Flow Monitoring Inflow/Infiltration Study by V&A (June 2012)
- Vista 2035 East Palo Alto General Plan (October 2016)
- Ravenswood Business District/Four Corners Specific Plan (November 2024)
- Ravenswood/Four Corners Specific Plan Update SEIR – Appendix G Utility Impact Study (June 2024)
- Sanitary Sewer Capital Improvement and Operation Plan Development Memorandum by F&L (November 2022)
- CCTV Survey Results Evaluation and Pipeline Replacement Priorities Area 2, Trunk Line, and All Areas by Sierra West (October 2023)
- Project Completion Report Areas 1, 2, 3, 4, and Trunkline Sanitary Sewer Pipeline Closed Circuit Television Inspection Project by Sierra West (March 2023)
- 2020 Urban Water Management Plan for City of East Palo Alto by EKI Environment & Water (June 2021)
- Records Review – Completed Construction Projects
    - Sewer Trunkline Realignment (2016 CIP)
    - Sanitary Sewer Replacement Project (2023 CIP)
    - Pulgas Ave – Mixed Use Project (2014 Private Improvements)
    - Light Tree Sanitary Sewer Replacement Project (2021 Private Improvements)
- Plan Review – Projects
    - 2120-2160 Euclid Ave (Mixed Use)
    - 2012-2043 Euclid Ave - Woodland Park Development (Housing)
    - 965 Weeks St - Colibri Commons (Housing)
    - 1804 Bay Road Development (Housing)
    - 2535 Pulgas Ave Development (Office)

2 Land Uses

Section 2 summarizes EPASD's existing sewer system system, service area, and land use conditions. The information was compiled through a review of previous studies, available documents, and data provided by EPASD.

2.1 Existing Sewer System

EPASD provides sewer system collection service to portions of the communities of Menlo Park and East Palo Alto, located in San Mateo County, within the San Francisco Bay Area. EPASD's service area is primarily residential with a few commercial and industrial parcels.

As shown in **Figure 2.1,** EPASD service area encompasses nearly 1,230 acres or 1.92 square miles. The collection system operates as a gravity sewer network, with approximately 61% of the existing pipelines consisting of 6-inch diameter lines. Larger collector lines range between 8-inch to 30-inches in diameter. The system includes a siphon beneath the San Francisquito Creek, which was realigned in 2017 with two parallel 22-inch high-density polyethylene (HDPE) pipes.

EPASD's sewer system collection system consists of approximately 33 miles of gravity sewer pipelines. Historically, manholes were constructed using brick and mortar, and pipelines were constructed with vitrified clay pipe (VCP).

EPASD operates and maintains the collection system in accordance with the State Water Resources Control Board, under the Statewide SSO Waste Discharge Requirements and the RWQCB Sewer System Management Plan guidelines. The collected sewer system is conveyed to the Palo Alto RWQCP for treatment and ultimate discharge to the San Francisco Bay.

All known SSOs that have been reported were due to maintenance issues. WBSD is currently conducting ongoing system maintenance and inspection efforts.

2.2 Population Served & Land Use Characteristics

As a part of the 2015 Masterplan, land use information was compiled from multiple sources for the communities served by EPASD. The following data sources were used to characterize the population and land use within the service area:

- Land Use Database – Existing land use data in Geographical Information System (GIS)
- General Plan Information – Additional land use data provided by the City
- Aerial Photographs – Reviewed to identify parcels and land use characteristics within the service area.

In 2017, the City adopted the 2035 General Plan, which outlines the City's vision for development and growth throughout the year 2035. The General plan includes a series of land use changes to balance the residential, commercial, and recreational spaces throughout the city.

The key changes within the 2035 General Plan include:

- Land use modifications occurred along University Avenue between Bay Road and Donohoe Street, as well as around the existing Target shopping center.
- Residential zoning changes within the Ravenswood Business District were modified from low-density and commercial to high-density along Maple Street.
- University Avenue west of Highway 101 include changes from commercial to office, mixed-use, and medium-density residential.

In 2024, the City adopted the Ravenswood Plan, which is the eastern portion of the city. The plan builds on the 2035 General Plan by providing a more detailed framework for future land use developments for the mixed-use areas within Ravenswood.

The land use changes in both the 2035 General Plan and Ravenswood Plan were incorporated into the 2025 Master Plan and the hydraulic model to reflect the anticipated future flows. The land use changes in both these plans are provided in **Appendix A.**

2.3 Existing Collection System Facilities

Since the completion of the 2015 Masterplan, EPASD has implemented several CIP projects to upgrade the existing sewer system. The upgrades to the system involve replacing the aging infrastructure with improved materials for both manholes and pipes. All new manholes were constructed with precast concrete, and new pipes were constructed with plastic pipe such as polyvinyl chloride (PVC) or HDPE.

The sewer system improvements completed since the 2021 Master Plan Addendum are illustrated in **Figure 2.2**. The improvements include 6,688 linear feet (LF) of newly installed sewer pipe.

The following is a summary list of the scope of work and highlight the improvements implemented across the two different projects.

1. Light Tree (2021)

   As part of a private development project in 2021, the sewer infrastructure was improved on O'Connor Street, Pulgas Avenue, and Clarke Avenue. The project improvements included:

   - Installing 9 new manholes.
   - Reconstructing 1 manhole.
   - Installed or replaced:
     - 132 LF of 6-inch PVC.
     - 76 LF of 10-inch PVC.
     - 297 LF of 12-inch PVC.
     - 1,310 LF of 16-inch PVC.
     - 1,149 LF of 18-inch PVC.

2. Sanitary Sewer Replacement Project (2023)

As a part of the 2023 CIP project, multiple areas of EPASD sewer system were replaced/repaired. The projects occurred along Beech Street, Clarke Ave, Green Street, and O'Connor Street. The improvements included:

- Installing 7 new manholes.
- Rehabilitating 21 manholes.
- Installing or replacing:
    - 764 LF of 30-inch PVC.
    - 1,021 LF of 24-inch PVC.
    - 1,323 LF of 20-inch PVC.
    - 395 LF of 14-inch PVC.
    - 486 LF of 18-inch PVC.

3 Sanitary Sewer Flow Analysis

Section 3 summarizes the background and methodology used to determine existing and future dry weather sewer system flows for input to EPASD's collection system hydraulic model.

3.1 Infiltration and Inflow

V&A Flow Monitoring Report included a sanitary sewer flow monitoring inflow/infiltration (I&I) study in 2011-2012 for East Palo Alto. The study separated the service area into different flow monitoring sites, and the results were used to identify the average dry weather flow, peak dry weather flow, and peak wet weather flow. The flow monitoring locations are shown in **Figure 3.1** with areas in **Table 3.1**. The peaking factor results from the study are provided in **Table 3.2.**

3.2 Calculation of Flows

The V&A Flow Monitoring Report provided the data used to calculate sewer system flows for EPASD's existing hydraulic system. Based on three scenarios described later in later in this report, the following method was used to calculate the estimated additional sanitary sewer flows for each parcel. The calculated injection flows were inserted into the recalibrated 2014 Sewer Map in SewerGEMs that is further described in Section 4.

The calculation of flow injections uses a similar process as described in the 2021 Master Plan. As EPASD does not monitor flows from each individual parcel, a multiple-step process was followed to calculate the incremental additional flow by parcel. The major steps taken to estimate incremental additional flow by parcel are as follows:

1. Existing flow from each parcel was estimated and key aspects included:
    a. The 2019 Tax Year Billing Charges were reviewed to identify the individual parcel billings.
    b. Based on the individual billings, the Equivalent Dwelling Units (EDU) were calculated by dividing the parcel bill by $575 per EDU.
    c. The calculated number of EDUs by parcel was then multiplied by 200 gallons per EDU to estimate the existing sanitary sewer flow from each parcel. This represents an update and decrease in flow per EDU, previously established at 240 gallons per EDU. This new value is in line with modern plumbing standards, other local water districts, and use of more water efficient products and landscaping trends.
2. Total flow from each parcel based on the 2035 General Plan and Ravenswood Plan's revised zoning was then estimated:
    a. The Maximum and Minimum Allowable Density and Floor to Area (FAR) ratio for each zoning category was identified in the 2035 General Plan and Ravenswood Plan. The land use characteristics for these calculations are included in **Appendix A**.

b. Using 50-percent of the range between maximum and minimum allowable density and FAR for each parcel, the estimated total sanitary sewer flow for non-residential was calculated using the unit flow rates from *East Palo Alto Sanitary District Standard Specifications for Design and Construction of Sanitary Collection and Conveyance Facilities* (Standard Specifications) report dated June 2002.

3. Lastly, total additional flow by parcel for both Average Dry Weather Flow (ADWF) and Peak Wet Weather Flow (PWWF) was calculated:
    a. ADWF for existing conditions presented is subtracted from ADWF for future zoning changes based on each scenario.
    b. PWWF was calculated by multiplying the ADWF for each parcel by the Sewer Basin PWWF Peaking Factor from **Table 3.2**. As there are no current-day studies for the I&I in the system, the peaking factor results from the V&A study were used to calculate the future PWWF flows.

3.3 Water Supply Service

As part of the verification of the predicted sewer model, F&L evaluated current drinking water imports into the service area. The City of EPA water supply is sourced from two primary channels: purchased water from San Francisco Public Utilities Commission (SFPUC) or groundwater extracted from wet wells. According to EPA's Supply Assurance, SFPUC is required to provide an Individual Supply Guarantee (ISG) of 3.46 MGD of drinking water to the City. As detailed in **Section 4.3**, the projected 2035 Enhanced ADWF sewer flow for the future buildout is approximately 3.3 MGD. This indicates that the anticipated water supply exceeds the projected sewer demand, demonstrating sufficiency in meeting future needs.

3.4 Sewer System Treatment Capacity.

The Palo Alto Regional Water Quality Control Plant (RWQCP) records the total sewer system flow for EPASD and neighboring cities. The RWQCP is permitted to treat an average dry weather flow of 39 MGD. EPASD has an agreement with the RWQCP, where EPASD's average annual flow capacity treatment allotment is 3.06 MGD, 7.64% of the RWQCP's total capacity.

4 Hydraulic Model Development

Section 4 summarizes assumptions, items considered during model development and calibration, and key components of the completed hydraulic model. The hydraulic model was used to perform different scenarios to assess the impacts of future developments, land use changes, and any system configuration changes.

4.1 Model Components

The hydraulic model transforms information about the physical and operational characteristics of the sewer system into a mathematical model. The modeling results provide information on flows, flow depth, velocity, surcharge, and the hydraulic grade line, which were used to analyze system performance and identify system deficiencies. The model results were used to verify the adequacy of recommended or proposed system improvements.

The hydraulic model comprises a skeletonized network of nodes and conduits, which define the physical properties within EPASD's system. The following descriptions provide information on elements used in the development of the hydraulic model.

- Nodes: Nodes represent manholes and lamp holes. All flows added into the model are attached to node structures. The data required for node structures include pipe invert elevation, manhole rim elevation, and manhole diameter.
- Conduits: Conduits represent pipes that convey sewer system from one point in the system to another. The conduits include gravity pipes and siphons. The physical data for gravity pipes include pipe invert elevation, size, length, and friction factor.

4.2 Model Calibration

The 2025 Master Plan was constructed using EPASD's GIS sewer system collection system, which includes information on the pipe material, pipe invert elevation, manhole rim elevations, pipe diameter, and pipe length. The GIS model was inserted into SewerGEMs.

As the previous sewer model developed using Hydra 7 software is outdated and no longer supported, the City approved transition to a modern platform that is better integrated with GIS. F&L rebuilt the EPASD sewer system model using SewerGEMS software using archived GIS data, databases, and field data, with a detailed ArcGIS sewer map being used as the foundation. SewerGEMS model results aligned with historical data, predicting flows, hydraulic grade lines, and surcharge locations. As the SewerGEMs model was validated, it serves as the basis for assessing system performance under current 2025 conditions and the 2035 future conditions to support updates to EPASD's Master Plan. A detailed description of the methodology and results is provided in **Appendix B**.

4.3 Model Scenarios

Scenario 1: 2025 Conditions

The first step in analyzing the system was to update the GIS Sewer Map to reflect the current conditions of 2025. The map was updated for all sewer improvements found during the records review. The sewer system flows from the known developments built to date were calculated using the method discussed in **Section 3.2**. The known developments shown in **Figure 4.1** include:

- 2485 Pulgas Avenue (Private Improvements)
- Light Tree Apartments
- Mid-Pen Housing (965 Weeks)
- University Plaza Phase 1
- 1950 Bay Road

The additional ADWF and PWWF by parcel are summarized in **Table 4.1**, with the total additional ADWF and PWWF presented at the bottom of the table. The additional ADWF is 92,574 GPD and the PWWF is 139,893 GPD. The total sewer flows for 2025 for ADWF is 1,586,080 GPD and PWWF is 5,880,153 GPD. The results from the 2025 conditions are used to assess any existing sewer capacity issues before additional development occurs within the EPASD boundaries. A detailed breakdown of the flow calculations is provided in **Appendix C**.

Scenario 2: 2035 Conditions

The next step in analyzing the system was to understand the capacity improvements that would be needed to serve new development based on the potential impact of the land use changes. The future conditions are described as the 2035 Conditions, which includes land use changes from the 2035 General Plan and Ravenswood Specific Plan.

Figure 4.2 shows the locations for the 2035 future flows to be injected into the model. The additional ADWF and PWWF by parcel are summarized in **Table 4.2**, with the total additional ADWF and PWWF presented at the bottom of the table. The additional ADWF is 1,472,639 GPD and the PWWF is 2,322,519 GPD. The total sewer flows for 2035 for ADWF is 2,966,145 GPD and for PWWF is 8,062,778 GPD.

A detailed breakdown of the flow calculations is provided in **Appendix C**.

Scenario 3: Enhanced Conditions

Once the additional flow based on the potential land use changes were inserted into the model, the next step was to update and analyze the system using known planned developments that were approved or in review by EPASD. The scenario represents the maximum buildout potential and is described as 2035 Enhanced Conditions, which include the 2035 General Plan, Ravenswood Specific Plan, and Planned Developments. The flows in these areas were recalculated based on the known and approved developments. The known developments shown in **Figure 4.3** include:

- University Plaza Phase 2
- 2331 University Avenue
- Weeks Street Townhomes
- 2519 Pulgas Avenue
- 2535 Pulgas Avenue
- 1675 Bay Road
- 2001 Manhattan
- 2101 Runnymede

The additional ADWF and PWWF by parcel are summarized in **Table 4.3**, with the total additional ADWF and PWWF presented at the bottom of the table. The additional ADWF is 1,846,104 GPD and the PWWF is 2,903,896 GPD. The total sewer flows for 2035 for ADWF are 3,339,610 GPD and PWWF are 8,644,156 GPD. A detailed breakdown of the flow calculations is provided in **Appendix C**.

The projected ADWF under Scenario 2 and Scenario 3 is approximately 3.0 MGD and 3.3 MGD, respectively. These projections are consistent with the cumulative flow estimates presented in the *Ravenswood/Four Corners Specific Plan Update SEIR – Appendix G Utility Impact Study* (Utility Impact Study) prepared by Schaaf & Wheeler. The projected future cumulative demands—ranging from 3.0 to 3.3 MGD—fall within the Utility Impact Study's estimated cumulative flow range of 3.13 to 3.33 million gallons per day (MGD).

As described earlier, EPASD's allocated dry weather treatment capacity at the RWQCP is 3.06 MGD. Although the projected cumulative flows slightly exceed this capacity, the planned capital improvements are expected to reduce I&I, thereby potentially mitigating peak flow impacts.

In order to ensure sufficient long-term treatment capacity, it is recommended that EPASD:

- Reestablish a collection system flow monitoring program similar to the sites presented in **Table 3.1** and **Figure 3.1**. Continue monitoring system flows at the treatment plant as new development occurs.
- Reassess the effectiveness of I&I reduction measures following project implementation.

These actions will align system performance with treatment capacity limits and support EPASD's planning and regulatory compliance goals.

5 System Capacity Analysis

Section 5 evaluates EPASD's sewer system collection system capacity constraints under flow conditions projected during EPASD's design storm. This section summarizes the planning and capacity criteria, identifies predicted capacity limitations, and defines the methodology used to recommend appropriate solutions and strategies to address the identified issues.

5.1 Design Storm Criteria

Design storms are simulated rainfall events used to evaluate collection system capacity under wet weather flow conditions. A specific recurrence interval and rainfall duration define each design storm. EPASD's goal is to identify predicted SSOs that occur during the 10-year, 24-hour design storm.

The master plan evaluates the ability of the system to convey flows with surcharging under the selected design storm scenario. EPASD has selected as its design storm a rainfall event of 10-year recurrence intervals and 24-hour duration (10-year, 24-hour storm), as defined by the NOAA rainfall atlas.

5.2 Pipeline Hydraulic Capacity Criteria

Hydraulic capacity assessments were conducted to establish standards for identifying when pipes exceed EPASD's acceptable surcharge limits. Under these criteria, a pipe may be considered theoretically capacity-deficient when, during PWWF conditions associated with the design storm, the water level or hydraulic grade line (HGL) rises above the top of the pipe.

While such conditions may not always result in an overflow, they indicate a potential deficiency in the pipe capacity. Exceptions to this criterion are made for siphons, which are designed to operate under surcharge conditions. All identified capacity-deficient pipelines are recommended for phased replacement, as outlined in Chapter 9, Capital Improvement Program.

In the 2015 Master Plan, pipeline capacity under projected development impacts was evaluated using the depth-to-diameter (d/D) ratio under peak dry weather flow (PDWF). This metric helped determine capital improvements needed to restore or maintain acceptable d/D values across the system. The 2025 Master Plan adopts a revised capacity deficiency criterion. The d/D method was replaced because it does not consider the effects of system aging, velocities, maintenance challenges, or non-uniform flow conditions.

In place, the revised criteria applies a freeboard-based standard that requires all pipes and manholes to maintain a minimum four-foot freeboard under design storm conditions. In areas where pipe depth is less than four feet and the freeboard criterion cannot be applied, an alternative criterion is used that no SSOs should occur under the modeled conditions.

5.3 System Capacity Deficiencies

To assess existing and future performance of EPASD's sewer system, hydraulic modeling was conducted for three planning scenarios: 2025 Existing Conditions, 2035 Base Conditions, and 2035 Enhanced Conditions. These scenarios incorporated projected PWWF and were used to identify system deficiencies and capacity limitations.

- Scenario 1: 2025 Conditions

The 2025 Conditions were first analyzed in the model to understand the existing system deficiencies. The PWWF discussed in Section 4.3 was add to the model. The results indicated no SSOs at any manholes; however, approximately 42,600 LF of pipeline were predicted to surcharge with less than four feet of freeboard. The results from the model are shown in **Figure 5.1** and model results are provided in Appendix D.

- Scenario 2: 2035 Conditions

The next scenario that was analyzed in the model was 2035 Conditions. The PWWF flows discussed in Section 4.3 was added to the model. Under this scenario, SSOs were predicted at 22 manholes and approximately 97,600 LF of pipe segments were identified as surcharging with less than four feet of freeboard. The results from the model are shown in **Figure 5.2** and model results are provided in Appendix D.

- Scenario 3: 2035 Enhanced Conditions

The final scenario evaluated incorporates 2035 Enhanced conditions, which account for planned developments and increased flow projections outlined in Section 4.3. The model predicted SSOs at 22 manholes with approximately 102,900 LF of surcharged pipe segments that do not provide four feet of freeboard. The results from the model are shown in **Figure 5.3** and model results are provided in **Appendix D**.

6 Collection System Assessment

The purpose of this section is to present an evaluation of the pipeline condition based on capacity and structural deficiencies throughout the collection system. Based on hydraulic modeling and condition assessment data, a set of recommended strategies has been developed to address identified system deficiencies. These recommendations are categorized into four groups based on the type of deficiency, each addressed in a dedicated subsection:

- Category 1: Existing Pipe Capacity Deficiencies
- Category 2: Future Pipe Capacity Deficiencies
- Category 3A: Pipe Structural Deficiencies
- Category 3B: Remaining Pipe in the Sewer System

6.1 Category 1: Existing Pipe Capacity Deficiencies

Category 1 addresses current hydraulic capacity deficiencies that exist under present-day flow conditions. As described in **Section 5**, the hydraulic modeling identified segments that fail to meet the minimum four-foot freeboard criteria for surcharging under PWWF.

To address the current deficiencies within the system, approximately 7,285 LF of pipe will require upsizing. The improvements not only improve deficiencies within the pipeline section itself but also reduce the HGL on upstream lines. The overall benefit of improving only 7,285 LF of pipe will bring approximately 21,058 LF of pipeline in compliance with the design criteria. Although there are remaining pipes that do not meet the design criteria, the pipes do not cause any concern of SSOs within the system.

The Category 1 projects will provide the hydraulic capacity and improve the operations of the present-day system. **Figure 6.1** illustrates the locations and proposed diameter increases for each of the deficient pipes. **Table 6.1** lists all the pipe segments identified and the proposed size.

6.2 Category 2: Future Pipe Capacity Deficiencies

Category 2 focuses on addressing projected capacity constraints driven by future growth and development. The analysis was conducted using the 2035 Enhanced scenario, which incorporates flows from planned and approved development flows.

Category 2 projects will provide hydraulic capacity for approximately 13,848 LF of pipe must be upsized under PPWF. **Figure 6.2** illustrates the locations, and proposed diameter increases for each of the deficient pipes. **Table 6.2** lists all the pipe segments identified and the proposed size.

6.3 Category 3A: Existing Pipe Structural Deficiencies

Category 3A addresses the physical structural defects in the system identified through closed-circuit television (CCTV). Structural deterioration, such as cracking, deformation, joint separation, and root intrusion, can lead to failures within the system and affect the operations. The pipes within this

category were identified within the *CCTV Survey Results Evaluation and Pipeline Replacement Priorities Area 2, Trunk Line, and All Areas* by Sierra West as high-priority pipes to be replaced.

WBSD is currently performing ongoing sewer system maintenance assessments through cleaning and CCTV inspections. As of the date of this report, approximately three miles of pipe have been assessed. Once WBSD field investigation is completed, the proposed improvements should be evaluated for inclusion in the annual improvement budget for aging infrastructure.

Category 3A projects will provide improved resilience for approximately 9,796 LF of pipe was identified as structurally deficient and prioritized for replacement. **Figure 6.3** illustrates the location of the high-priority structural, same size replacement segments. **Table 6.3** lists all the pipe segments identified and the proposed size.

However, approximately 5,166 LF of pipes overlap with either Category 1 or Category 2 for hydraulic capacity. **Figure 6.4** illustrates the location of the pipes with both a high-priority structural deficiency and hydraulic capacity deficiency for improvements.

6.4 Category 3B: Remaining Pipe in the Sewer System

Category 3B addresses the remaining pipes within the collection system that have not been determined to either be capacity deficient or structurally deficient. Most of the existing collection system pipe segments are nearing or exceeding their anticipated service life, typically 50 to 75 years for vitrified clay pipes.

The total remaining length of pipe recommended for phased replacement from VCP to HDPE is approximately 73% of the existing system. **Figure 6.5** illustrates the remaining system segments slated for replacement.

7 Capital Improvement Program

Section 7 summarizes the Capital Improvement Program (CIP) projects, based on the categories discussed in Section 6 – Collection System Assessment. The CIP methodology was developed to establish a prioritized timeline for each project and provide an associated Conceptual Opinion of Probable Project Cost (OPPC).

7.1 Capital Improvement Program Development

Based on the classifications outlined in Section 6, a comprehensive evaluation of system improvements was conducted. All CIP project OPPC were developed at a planning level in 2025 dollars. The OPPCs include allowances for additional project components necessary for implementation, as shown below:

- Construction Contingency: 30%
- Design: 10%
- Environmental/Permitting: 10%
- Construction Management and Inspections: 15%
- District Administration: 5%

The cost factors listed above were applied uniformly across all categories to provide a consistent and comprehensive planning-level OPPC.

CIP projects were developed and grouped primarily with their improvement category. However, in several cases, the more than one category pipeline will be addressed by projects due to overlap or immediate proximity. Below is a summary of the project Groups

7.1.1 Category 1 Existing Conditions CIP Project Group

Category 1 CIP projects address existing capacity constraints and were divided into two separate project areas. Locations and project extents are illustrated in **Figure 7.1.** Taking advantage of project proximity, some additional Category 3A pipes improvements were also added into this CIP group.

The two projects, designated as CIP 1.1 and CIP 1.2, are both scheduled to initiate the design phase during the 2025–2026 fiscal year. CIP 1.1 is anticipated to begin construction in the 2026–2027 fiscal year. Due to the need for additional environmental permitting and coordination with PG&E, the design phase for CIP 1.2 is expected to span two fiscal years, from 2025 to 2027. Construction for CIP 1.2 is scheduled to commence in the 2027–2028 fiscal year and is projected to be completed in the 2028–2029 fiscal year.

The total estimated cost for the Category 1 CIP projects is approximately $17.4 million. The project summary OPPC breakdown is presented in **Table 7.1**. These projects are funded by the existing customer base. The detailed breakdown of the OPPC is included in **Appendix E**.

7.1.2 Category 2: Developer Related CIP Project Group

Category 2 CIP projects address anticipated capacity deficiencies associated with future development and were divided into seven distinct project areas, as shown in **Figure 7.2**. Similar to the Category 1 CIP group, portions of Categories 2 and 3 deficient pipes overlap. The capacity expansion of Category 2 deficient pipes within this CIP group remains developer-related, as increasing their size would not be required by the existing customer base. Taking advantage of project proximity, small portions of both Category 1 and 3 deficient pipes were also added to this Category 2 CIP group. Approximately 93% of the Category 2 CIP projects are directly developer-related.

The specific impacts and any associated fees for each project will be evaluated on a case-by-case basis. Developers may be responsible for preparing the design and performing the construction work under the supervision of the District. In certain instances, developers may be permitted to provide design and construction services as in-kind contributions, which may be credited toward their financial obligations to the District.

Due to the dependence on future development, the implementation schedule for Category 2 CIP projects should remain flexible and be reviewed regularly in coordination with EPASD. A sewer monitoring program is recommended as well to support project prioritization. If anticipated developments are delayed or not constructed, related structural improvements incorporated may require reclassification as higher-priority projects.

The total estimated cost for developer-related and adjacent deficient pipe CIP projects is approximately $52.8 million. The project summary OPPC breakdown is presented in **Table 7.2**. The detailed breakdown of the OPPC is included in **Appendix E**.

7.1.3 Category 3A: Existing Structural Deficiency CIP Project Group

Category 3A CIP projects address structural defects identified through CCTV inspections and were divided into four project areas. The projects were divided to be approximately $2 million over the next five years. Project locations are shown in **Figure 7.3**.

The total estimated cost for remaining structural deficiency CIP projects not covered in the other groups is approximately $7.3 million. The project summary OPPC breakdown is presented in **Table 7.3**. These projects are funded by the existing customer base. The detailed breakdown of the OPPC is included in **Appendix E**.

7.1.4 Category 3B: Aging Infrastructure CIP Project Group

Category 3B encompasses the remaining sewer system assets not currently identified as hydraulically or structurally deficient but nearing the end of their expected service life. These pipes are recommended for phased replacement over a 25-year period to maintain system integrity and service reliability. The OPPC for the remaining aging infrastructure CIP projects not covered in the other groups will be approximately $4.3 million per year, with an overall total of $107 million. The cost is based on slip lining and replacement hybrid concept approach. The cost is not reflective of the complete trenching and replacement of the sewer system, which would require additional analysis. The project

summary OPPC is presented in **Table 7.5**. Fund sources evaluation is recommended to support aging infrastructure improvements, such as the California Clean Water State Revolving Funds (SRF) funded by the Environmental Protection Agency (EPA).

7.1.5 Capital Improvement Projects – All Categories

A consolidated summary of all proposed CIP projects is presented in **Table 7.4**, including brief descriptions, cost estimates, and recommended implementation priority. The combined geographic distribution of these projects is illustrated in **Figure 7.4**. Detailed project summary sheets are provided in **Appendix E**, which include the scope of work and estimated OPPC values.

An annual budget of $2 million per year is recommended for Category 3B projects to replace the existing aging infrastructure. The phasing and prioritization should be determined through the following methods:

- Yearly maintenance inspections,
- Flow monitoring, and
- Available funding.

8 Rate and Impact Fee Study

Section 7 describes the methodology and summarizes the analysis that was used to determine the impact fee for future customers.

As part of the ongoing development of the Master Plan and identification of new CIP projects, EPASD intends to update its impact fee to accurately reflect the costs associated with planned system improvements and infrastructure expansion. The estimated impact fee based on the necessary CIP for the Category 2 project is $7,800 per EDU with an annual escalation. The calculation for the impact fee is presented in **Table 8.1**.

This fee has been calculated based on the following cost components, with a comprehensive summary included in **Appendix F**:

- Developer's share of existing capacity assurance: 25 percent of the costs are associated with existing capacity assurance improvements. These improvements are anticipated to provide capacity benefits for future growth. The developer-associated cost was determined through a flow-based analysis. It evaluated the projected increase in sewer system flow contributed by new development relative to total system demand.
- Developer's Improvement: 100 percent of the costs related to capacity deficiencies that are directly attributable to new development demands.
- Buy-In Treatment Cost: A buy-in cost of $5 million per 1.0 million gallons per day (MGD) of treatment capacity, representing the proportional reimbursement by developers for the available capacity at the PAWRQCP.

Table 7.1
Category 1 - CIP Project Summary
2025 Sewer System Master Plan
East Palo Alto, California

Project #	Improvement Description	Proposed Pipe Sizes	Approximate Length of Pipe (LF)	Projected OPPC ($)	Notes
1.1 (2)	Pipeline Replacement on Menalto Avenue, Poplar Avenue, Bay Road, and Elliot Drive	8-inch, 10-inch, 12-inch HDPE DR 17	4,833	$ 6,042,000	Projects will need Encroachmen Permit with City of Menlo Park. Project will involve crossing Bayshore Freeway.
1.2	Pipeline Replacement on Trunk Line in Creek, Beech Street, Larkspur Drive, and Gardenia Ave	8-inch, 12-inch, 16-inch, 30-inch HDPE DR 17	2,668	$ 11,315,000	Environmental Permits will be required. Trunk Line improvements are located on Creek. Coordination will be required for PG&E gas line.
		Total	**7,501**	**$ 17,357,000**	

Notes
(1) See Figure 7.1 for limits of improvements.
(2) Projects include Category 3 pipes that overlap with Category 1 deficiencies.

Abbreviations
CIP: Capital Improvement Program
DR: dimension ration
HDPE: high density polyethylene
LF: linear feet
OPPC: opinion of probable project cost

Table 7.2
Category 2 - CIP Project Summary
2025 Sewer System Master Plan
East Palo Alto, California

Project #	Improvement Description	Proposed Pipe Sizes	Proposed Development (If applicable)	Project Priority	Approximate Length of Pipe (LF)	Projected OPPC ($)	Notes
2.1	Pipeline Replacement on Bayshore Road, Donohoe Street, Cooley Ave, and O'Connor Street	8-inch, 10-inch, 12-inch, 24-inch HDPE DR 17	Woodland Parks (2001 Manhattan) & 2120-60 Euclid Avenue	See Note 2	3,460	$ 7,466,000	Project will involve crossing Bayshore Freeway. Project should be continued to be re-evaluated as structural deficiencies may be moved to a higher priority project if
2.2	Pipeline Replacement on University Avenue, Runnymede Street, Clarke Avenue, and Beech Street	10-inch, 12-inch HDPE DR 17	Woodland Parks (2001 Manhattan) & 2120-60 Euclid Avenue	See Note 2	4,188	$ 9,795,000	Project will include coordination with PG&E on gas line on Beech Street.
2.3	Pipeline Replacement on Trunk Line in Creek	30-inch HDPE DR 17	Ravenswood Area	See Note 2	2,981	$ 17,635,000	Environmental Permits will be required. Trunk Line improvements are located on
2.4	Pipeline Replacement on Bay Road and Pulgas Avenue	8-inch, 10-inch, 24-inch, 30-inch HDPE DR 17	2485 Pulgas Avenue (3) 2535 Pulgas Ave (Office) 2519 Pulgas Ave (Office) 1804 Bay Road 1675 Bay Road	See Note 2	2,799	$ 9,293,000	Project should be continued to be re-evaluated as structural deficiencies may be moved to a higher priority project if proposed development projects are not constructed soon.
2.5	Pipeline Replacement on Maple Lane	10-inch HDPE DR 17	Mid-Pen Housing (965 Weeks Street) (3)	See Note 2	1,161	$ 1,401,000	
2.6	Pipeline Replacement on O'Connor Street. Project will also include 11 Smart Cover Meters to be installed similar to the subbasin locations notated in V&A Flow Monitoring Study.	12-inchHDPE DR 17	Light Tree Apartments (East Bayshore Road) (3)	See Note 2	841	$ 1,377,000	Project will require coordination for two 24-inch PG&E Gas Main Transmissions. Project will also reinstate City's Flow Monitoring Program.
2.7	New Parallel Trunk Line within San Francisquito Creek on Palo Alto Golf Course	24-inch HDPE DR 17	Ravenswood Area	See Note 2	1,569	$ 5,832,000	Project should be re-evaluated on a yearly basis. As project scope on developments may be reduced/removed.
				Total	**17,000**	**$ 52,799,000**	

Notes
(1) See Figure 7.2 for limits of improvements.
(2) Project timeline will be dependent on when the proposed developments are constructed. City to assess every fiscal year.
(3) Developments have already been completed or are nearing completion..

Abbreviations
CIP: Capital Improvement Program
DR: dimension ration

Category 3A - CIP Project Summary
2025 Sewer System Master Plan
East Palo Alto, California

Project #	Improvement Description	Proposed Pipe Sizes	Approximate Length of Pipe (LF)	Projected OPPC ($)
3.1	Pipeline Replacements on Dumbarton Avenue, Palo Verde Way, and Lilac Lane.	8-inch HDPE DR 17	1,786	$ 1,786,000
3.2	Pipe Replacements on Garden Street, Clarke Avenue, Pulgas Avenue, Woodland Avenue, and Bayshore Road.	8-inch, 10-inch HDPE DR 17	1,899	$ 1,949,000
3.2	Pipe Replacements on Glen Way and Capitol Avenue.	8-inch HDPE DR 17	1,425	$ 1,398,000
3.2	Pipe Replacements on Bay Road and Weeks Street.	8-inch, 16-inch, 18-inch HDPE DR 17	1,138	$ 2,155,000
		Total	**6,248**	**$ 7,288,000**

Notes
(1) See Figure 7.3 for limits of improvements.
(2) Pipes within this project category are all remaining pipes that have not been included in Category 1 or Category 2. projects.

Abbreviations
CIP: Capital Improvement Program
DR: dimension ration
HDPE: high density polyethylene
LF: linear feet
OPPC: opinion of probable project cost

Table 7.4
Overall – Proposed Capital Improvement Plan
2025 Sewer System Master Plan
East Palo Alto, California

Project #	Improvement Description	Proposed Pipe Sizes	Proposed Development (If applicable)	Project Priority	Approximate Length of Pipe (LF)	Projected OPPC ($)	Notes
1.1	Pipeline Replacement on Menalto Avenue, Poplar Avenue, Bay Road, and Elliot Drive	8-inch, 10-inch, 12-inch HDPE DR 17			4,833	$ 6,042,000	Projects will need Encroachment Permit with City of Menlo Park. Project will involve crossing Bayshore Freeway.
1.2	Pipeline Replacement on Trunk Line in Creek, Beech Street, Larkspur Drive, and Gardenia Ave	8-inch, 12-inch, 16-inch, 30-inch HDPE DR 17			2,668	$ 11,315,000	Environmental Permits will be required. Trunk Line improvements are located on Creek. Coordination will be required for PG&E gas line.
2.1	Pipeline Replacement on Bayshore Road, Donohoe Street, Cooley Ave, and O'Connor Street	8-inch, 10-inch, 12-inch, 24-inch HDPE DR 17	Woodland Parks (2001 Manhattan) & 2120-60 Euclid Avenue	See Note 2	3,460	$ 7,466,000	Project will involve crossing Bayshore Freeway. Project should be continued to be re-evaluated as structural deficiencies may be moved to a higher priority project if proposed development projects are not constructed soon.
2.2	Pipeline Replacement on University Avenue, Runnymede Street, Clarke Avenue, and Beech Street	10-inch, 12-inch HDPE DR 17	Woodland Parks (2001 Manhattan) & 2120-60 Euclid Avenue	See Note 2	4,188	$ 9,795,000	Project will include coordination with PG&E on gas line on Beech Street.
2.3	Pipeline Replacement on Trunk Line in Creek	30-inch HDPE DR 17	Ravenswood Area	See Note 2	2,981	$ 17,635,000	Environmental Permits will be required. Trunk Line improvements are located on Creek.
2.4	Pipeline Replacement on Bay Road and Pulgas Avenue	8-inch, 10-inch, 24-inch, 30-inch HDPE DR 17	2485 Pulgas Avenue (3) 2535 Pulgas Ave (Office) 2519 Pulgas Ave (Office) 1804 Bay Road 1675 Bay Road	See Note 2	2,799	$ 9,293,000	Project should be continued to be re-evaluated as structural deficiencies may be moved to a higher priority project if proposed development projects are not constructed soon.
2.5	Pipeline Replacement on Maple Lane.	10-inch HDPE DR 17	Mid-Pen Housing (965 Weeks Street) (3)	See Note 2	1,161	$ 1,401,000	
2.6	Pipeline Replacement on O'Connor Street. Project will also include 11 Smart Cover Meters to be installed similar to the subbasin locations notated in V&A Flow Monitoring Study.	12-inchHDPE DR 17	Light Tree Apartments (East Bayshore Road) (3)	See Note 2	841	$ 1,377,000	Project will require coordination for two 24-inch PG&E Gas Main Transmissions. Project will also reinstate City's Flow Monitoring Program.
2.7	New Parallel Trunk Line within San Francisquito Creek on Palo Alto Golf Course	24-inch HDPE DR 17	Ravenswood Area	See Note 2	1,569	$ 5,832,000	Project should be re-evaluated on a yearly basis. As project scope on developments may be reduced/removed.
3.1	Pipeline Replacements on Dumbarton Avenue, Palo Verde Way, and Lilac Lane.	8-inch HDPE DR 17			1,786	$ 1,786,000	
3.2	Pipe Replacements on Garden Street, Clarke Avenue, Pulgas Avenue, Woodland Avenue, and Bayshore Road.	8-inch, 10-inch HDPE DR 17			1,899	$ 1,949,000	
3.3	Pipe Replacements on Glen Way and Capitol Avenue.	8-inch HDPE DR 17			1,425	$ 1,398,000	
3.4	Pipe Replacements on Bay Road and Weeks Street.	8-inch, 16-inch, 18-inch HDPE DR 17			1,138	$ 2,155,000	
				Grand Total	30,750	$ 77,444,000	

Notes
(1) See Figure 7.4 for limits of improvements.
(2) Project timeline will be dependent on when the proposed developments are constructed. City to assess every fiscal year.
(3) Developments have already been completed or are nearing completion.
(4) Category 3B projects will include the remaining portion of the sewer system 74% for existing VCP is suggested to be replaced over a 25-year period based on available funds. The OPPC for the remaining aging infrastructure will be approximately $4.3 M/yr (6,000LF/yr), with an overall total of $107 M. It is important to note that this cost is based on slip lining repair and partial replacement only.

Abbreviations
CIP: Capital Improvement Program
DR: dimension ration
HDPE: high density polyethylene
LF: linear feet
OPPC: opinion of probable project cost

Table 7.5
Category 3B - CIP Project Summary
2025 Sewer System Master Plan
East Palo Alto, California

Project #	Improvement Description	Proposed Pipe Sizes	Unit	Unit Price ($)	Approximate Length of Pipe (LF)	Projected OPPC ($)
-	Slip line, repair and replacement	8-inch through 24-inch HDPE DR 17	LF	$ 750	142,928	$ 107,196,000

Total	**142,928**	**$ 107,196,000**
Average Annual Totals (4)	**5,717**	**$ 4,287,840**

Notes
(1) Cost per LF is a general estimate based on use of predominately trenchless pipe repair systems and some as needed replacement. Use for conceptual purposes only.
(2) Cost for full replacement and manhole replacement will increase the OPPC.
(3) Project work would occur beyond the immediate timeline of CIP work presented in the Master Plan.
(4) Average annual cost is taken over a 25-year period.

Abbreviations
CIP: Capital Improvement Program
DR: dimension ration
HDPE: high density polyethylene
LF: linear feet
OPPC: opinion of probable project cost

Table 8.1
Impact Fee Calculations
2025 Sewer System Master Plan
East Palo Alto, California

AT FULL BUILDOUT		
Projected Total ADWF Increase (gpd) (1)		1,560,000
Projected Total EDU Increase (2)		7800
Development Share of Cost of Capacity Assurance (3)	$	4,380,500
Total Cost of Improvements Due to Development (4)	$	49,046,000
Total Cost of Treatment (5)	$	7,800,000
Impact Fee per EDU(6)	**$**	**7,800**

Notes

(1) Projected Total ADWF Increase is from the EPASD 2025 Sewer System Master Plan.
(2) Projected Total EDU Increase was calculated using a rate of 200 gpd/EDU.
(3) Refer to Sewer Impact Fee Memorandum, Table 2.
(4) Refer to Sewer Impact Fee Memorandum, Table 7.
(5) Total Cost of Treatment is based on EPASD reported cost of $5 million per 1.0 MGD of treatment capacity. It should be noted that EPASD current 7.96% ownership of the PARWQCP is equivalent to ADWF capacity of 2.9 MGD. The total project ADWF at full buildout is 2.2 MGD based on 200 gpd/EDU and 12,233 EDUs. Therefore, the Total Cost of Treatment presented above is for new development to buy-in to the available treatment capacity.
(6) Impact fee is calculated by dividing the total cost of improvements and treatment by the projected Total EDU increase and rounding to nearest $100.

2035 General Plan and Ravenswood Business Specific Plan Land Use Excerpts

Table 4-2: Land Use Classification System			
Major Classes	**Maximum Density / FAR**	**Land Use Designation and Summary Description**	**Maximum Building Height** (see zoning code for further restrictions and standards)
RESIDENTIAL	0 – 12 du/a	**Low Density Residential** (R-LD). Single-family dwellings, with 2nd units allowed on some parcels.	Maximum height of 2 stories and 26 feet.
	12 – 22 du/a	**Medium Density Residential** (R-MD). A range of multi-family residential uses including second units, single-family, duplex, triplex, quadplex, rowhouses, courtyard buildings and small-scale multi-family buildings.	Maximum height of 3 stories and 36 feet.
	22 – 43 du/a	**High Density Residential** (R-HD). A range of multi-family housing types ranging from townhomes to multi-family apartments at moderate to high densities.	Maximum height of 5 stories and 60 feet.
	43 – 86 du/a	**Urban Residential** (R-UHD). High-density multi-family dwellings (apartments, condos, and SROs).	Maximum height of 7 stories and 75 feet.
COMMERCIAL	Up to 22 du/a; 1.0 FAR	**Neighborhood Commercial** (NC). Local-serving retail, services and related uses.	Maximum of 3 floors or 36 feet.
	Up to 2.0 FAR	**General Commercial** (GC). Regional retail, office, and service-oriented business activities serving a community-wide population or broader market.	Maximum of 3 stories and 75 feet.
	Up to 3.0 FAR	**Office** (OC). Single-tenant or multi-tenant offices that include professional, legal, medical, financial, corporate and general business offices.	Maximum of 8 stories or 100 feet, whichever is greater.
MIXED USE	Up to 22 du/a; 1.0 FAR	**Mixed Use Low** (MUL). Low-density mixed-use.	Maximum of 3 stories and 36 feet.
	Up to 65 du/a; 1.75 FAR	**Mixed Use Corridor** (MUC). Multi-story mixed-use buildings.	Maximum 5 stories or 60 feet.
	Up to 86 du/a; 2.5 FAR	**Mixed Use High** (MUH). Multi-story mixed-use buildings at a larger scale than MUC.	Maximum of 8 stories or 100 feet, whichever is greater.
INDUSTRIAL	Up to 1.0 FAR	**General Industrial** (I-G). Industrial (storage and manufacturing), and R&D (lab/medical).	Maximum of 3 stories or 30 feet.
	Ranges from 0.75 to 3.0 FAR	**Industrial Buffer** (I-B). High-quality office buildings, along with a limited range of manufacturing and repair businesses.	Maximum of 8 stories or 100 feet. Maximum height within 200 feet of University Village area is 3 stories above grade.
COMMUNITY	Determined during approval	**Parks/Recreation/Conservation** (PRC). Public recreational uses, including park and open space.	n/a
	N/A	**Resource Management** (RM). Preservation of sensitive open space lands in a natural condition.	n/a
	N/A	**Public/Institutional** (PI). Education, city buildings, fire/police stations, & other uses.	n/a

SANITARY SEWER MODEL CALIBRATION MEMO

FREYER & LAURETA, INC.
Civil Engineers – Surveyors – Construction Managers

Memorandum

Re: East Palo Alto – Rebuilding EPASD sewer model in SewerGEMS
Date: May 1, 2025
To: Richard Perez, City of East Palo Alto
Humza Javed, P.E. City of East Palo Alto
From: Greg Arifian P.E., Freyer & Laureta, Inc.
Rheanna Ostrea, Freyer & Laureta, Inc.
Zoe Gnass, Freyer & Laureta, Inc.
Reviewed: Jeff Tarantino, Freyer & Laureta, Inc.

1 Introduction

Freyer and Laureta, Inc. (F&L) has prepared this memorandum to document the development of a new sewer collection system model. The East Palo Alto Sanitary District's (EPASD) wastewater collection system was developed by EPASD using Hydra 7 software by Pizer Incorporated (Hydra 7). The Hydra 7 hydraulic model was first used by EPASD in the 2015 Master Plan. The hydraulic model created a mathematical representation based on the physical properties and operational information of the system and was calibrated using field data. As the initial Hydra 7 model software is no longer supported, the model needed to be rebuilt with modern software. F&L was tasked to recreate the hydraulic model using a GIS-based hydraulic model platform, which was done using SewerGEMS within OpenFlows Sewers Advanced by Bentley Systems, Incorporated. This memorandum outlines the steps that were taken to recreate and validate the model.

2 Model Methodology

F&L used a structured workflow to develop the SewerGEMS model. The legacy Hydra7 software was inaccessible, so the approach began with a research phase. This involved compiling archived and limited GIS sewer maps, PDFs, and database output files. Thereafter a series of tasks were developed, often iterative, to produce a final working model. The major tasks and sub-tasks identified became the basis of the model rebuilding approach and included:

1. Model Development
    a. Gathering archived 2014 field, model, and mapping data used in the 2015 Master plan
    b. Re-building a complete and detailed sewer map in GIS
    c. Importing sewer model and field flow data
2. SewerGEMS model Calibration
    a. Iteratively updating sewer properties through calibration
    b. Developing the Average Dry Weather Calibration buy analyzing HGL
    c. Therafter completing the Peak Wet Weather Calibration
3. Peformaing final quality checks on the SewerGEMS model results for final accuracy
4. Next steps: Model the 2025 and 2035 sewer conditions

3 Model Development

3.1 Gather Archived Model and Mapping Data

The first step in developing the updated model was to gather all available datasets from EPASD to support the construction of the ArcGIS sewer map using existing EPASD shapefiles, Microsoft Access database files, and Excel spreadsheets associated with the Hydra7 model developed for the 2015 Master Plan. Once all data sources were assembled, the information was reviewed and organized to confirm the accuracy and completeness of the sewer system inputs required for GIS mapping.

3.2 Build ArcGIS Sewer Map

The next step in the modeling process was to construct an accurate and functional ArcGIS map of EPASD's sewer system. The GIS map serves as the spatial foundation for the hydraulic model and must reflect reliable infrastructure attributes and connectivity. Archived GIS shapefiles were imported into ArcGIS and systematically compared to the Hydra7 model databases to verify the accuracy of system components, including manholes, pipes, and associated attributes.

To ensure data accuracy, key infrastructure attributes were reviewed across the archived GIS shape and model files. These features included manhole IDs, rim and invert elevations, pipe lengths, diameters, friction factors, and connectivity. The Hydra7 model contained the most recent field-verified measurements and system-wide modeling results and was used as the primary reference for validating and correcting discrepancies in the spatial data.

The following assumptions were applied in developing the ArcGIS sewer map:

1. **Hydraulic Attribute Consistency:** The Hydra7 data was assumed to represent the most accurate and current values for manhole and pipe attributes, including rim and invert elevations, lengths, diameters, and Manning's *n* values.

2. **Pipe Material and Friction Factors:** A single Manning's roughness coefficient of $n = 0.013$ was applied throughout the system, consistent with vitrified clay pipe, the predominant material in EPASD's network, and validated by the *Civil Engineering Reference Manual*.

3. **Manhole Dimensions:** All manholes were modeled as 48-inch diameter circular structures, in accordance with EPASD standard design specifications.

4. **Invert Elevation Logic:** Invert elevations were assumed to match the lowest connected pipe at each manhole. Given EPASD's relatively flat topography and supporting field observations, this assumption provides a reasonable basis for establishing flowlines. The horizontal datum used is the North American Datum of 1983 (NAD83, NSR 2007), and the vertical datum is the National Geodetic Vertical Datum of 1929 (NAVD 29).

5. **Head Loss Representation:** Minor losses at manholes were incorporated using industry-standard head loss coefficients for pipe bends. These values were based on the Standard Loss Method as documented in Bentley's *OpenFlows Water Infrastructure* modeling software.

The GIS base map and associated attribute dataset formed the foundation for updating the hydraulic model and performing system capacity assessments.

3.3 SewerGEMS Model Development

Following the creation of the ArcGIS sewer map, the spatial data was imported into SewerGEMS within Bentley's OpenFlows Sewer Advanced platform to initiate hydraulic model development. Upon import, all manhole and pipe

segment attributes—including labels, elevations, and connectivity—were reviewed against the GIS map to ensure accurate data transfer.

During this verification process, several issues were identified and corrected prior to running any simulations:

1. **Duplicate and Conflicting Identifiers:** The imported GIS data contained several duplicate or conflicting manhole and pipe labels. The discrepancies were resolved by cross-referencing EPASD's official system map from the 2015 Master Plan. All naming conventions were updated within the GIS data to maintain consistency with EPASD records.

2. **Connectivity Errors:** Several manholes and pipes were found to be improperly connected or entirely disconnected within the GIS data. The GIS data was corrected to ensure continuous hydraulic flow throughout the modeled network.

To validate basic model functionality, ADWF from the Hydra7 dataset were input into the SewerGEMS model and used to run a preliminary test simulation. The test simulation served as an initial calibration step and revealed inconsistencies that required updates to certain model parameters. The following adjustments and assumptions were made:

1. **Head Loss Adjustments:** The original Hydra7 model did not account for head loss at manholes. When industry-standard head loss coefficients (as described in Section 3.2) were applied, the resulting flow levels did not align with observed average dry weather field data. To reconcile this, all head loss values at manholes (nodes) were temporarily set to zero for the purposes of model calibration.

2. **Ponding Area Assumptions:** Manholes were assigned a ponding area property value of zero. The ponding area assumption setting enabled the model to track and report the volume of predicted Sanitary Sewer Overflows (SSOs) lost during simulations. The approach was developed iteratively during the calibration process.

The updates described above resulted the SewerGEMS model accurately represented EPASD's sewer system and was properly configured for subsequent calibration and capacity analysis.

4 SewerGEMS Model Calibration

The SewerGEMS model calibration process focused on validating two critical parameters: (1) the hydraulic grade line (HGL) and (2) flow rates at model nodes. Calibration was conducted for two distinct flow scenarios: (1) Average Dry Weather Flow (ADWF) and (2) Peak Wet Weather Flow (PWWF). The methods used to validate input data for both scenarios is described in the follow sections.

4.1 Average Dry Weather Calibration

For ADWF conditions, flow inputs for all upstream manholes in the system were derived from the Hydra7 model Excel files. **Figure 1** illustrates the locations of the upstream manholes, which were designated as flow injection points. The total ADWF injection flow was cross-checked and validated against the Hydra7 model database, which reports a total system flow of 1.53 million gallons per day (MGD).

SewerGEMS model results for ADWF were compared against Hydra7 model data and available field data for flow rates and maximum HGL at each manhole. **Table 1** presents the comparison of flows and HGL values between the two models. The comparison showed good agreement, with a few outliers identified. These discrepancies are addressed in more detail in Section 5.1, *Average Dry Weather Results*.

The ADWF calibration step confirmed that the input parameters were accurately transferred to the SewerGEMS model and that base flow conditions were properly established. With ADWF successfully calibrated, the next step was to validate the model under peak wet weather conditions.

4.2 Peak Wet Weather Calibration

The calibration of the PWWF involved importing the injection flows from the Hydra7 model into SewerGEMS. The resulting predictions for surcharge and SSOs did not align with those from the Hydra7 model, likely due to insufficient information on how the Hydra7 model accounted for surcharged conditions and SSOs. The discovered discrepancy prompted an iterative process to investigate and resolve the differences in model results, leading to the following findings:

1. **Flow Losses:** Model simulations indicated flow losses within the system. To address this, a ponding property was added to capture and return the predicted SSOs, as outlined in Section 2.3. This property update was applied system-wide for both ADWF and PWWF scenarios.

2. **Surcharge and SSOs:** Hand-calculated hydraulic analyses showed that the Hydra7 model predicted surcharge and SSOs in locations where they were unlikely to occur. These predictions did not align with field observations or the EPASD's operational experience. As a result, the SewerGEMS model was found to more accurately reflect existing conditions.

3. **Flow Adjustments:** Discrepancies were observed in the injection flow rates, with high flows in single-family housing areas and low flows in multi-family dwellings. To correct this, flow injections at selected upstream manholes were adjusted to better align with EPASD's 2013 zoning data. Flow rates in single-family areas were reduced, while multi-family areas received increased flow injections. These adjustments maintained the total system flow of 5.78 MGD, as recorded in the Hydra7 database, and provided a more realistic loading scenario across the system. Table 2 summarizes the changes in injection flows and the affected manholes.

5 SewerGEMS Model Results

Following the calibration process described in the previous section, the SewerGEMS model results were compared to the original hydraulic data from the Hydra7 model from the 2015 Master Plan. The comparison between the Hydra 7 and SewerGems output was performed to assess the accuracy and reliability of the SewerGEMS model in representing the system's performance under both ADWF and PWWF conditions. The sections below detail the methods used for this comparison and summarize the key findings from each scenario.

5.1 Average Dry Weather Results

For ADWF, the maximum HGL from SewerGEMS at each manhole was compared to the HGL from the original Hydra7 model. In most cases, the predicted HGLs from SewerGEMS differed by no more than 6 inches from those predicted by the Hydra7 model, as shown in **Table 1.**

Five manholes were identified as outliers, likely due to one of the following causes:

1. Locations near manholes with split flow directions or passive bypass piping, as shown in **Figure 2**. Manhole Outliers: E33, L10, M2, M3.

2. Duplicate manhole identifications, as discussed in Section 2.2. The Hydra7 model presented multiple data points for these manholes, making it unclear which data should be used for comparison. Manhole Outlier: H29.

Figure 3 shows the manhole outliers, which exhibited HGL differences ranging from nine inches to 24 inches, with SewerGEMS predicting lower HGLs than the Hydra7 model. The discrepancies are likely due to differences in routing strategies between the two models. However, as these outliers had minimal impact on adjacent branches, the outliers were considered insignificant in terms of overall model accuracy.

The full model outputs for ADWF are included in **Attachment 1**.

5.2 Peak Wet Weather Results

As described in Section 3.2, the PWWF model results could not be fully validated using HGL comparisons due to inconsistencies in the model. To verify the PWWF results, the following methods were used:

1. Manhole flows were compared to ensure that the total system flow of 5.78 MGD matched the total flow in Hydra7.
2. Predicted SSO locations were validated within the model.
3. System segments known to be surcharged, based on historical data and field observations, were validated in the model, including previous bypass pumping plans and flow metering results.

Figure 4 presents a map of predicted SSOs and surcharged segments in SewerGEMS. The model outputs and hydraulics for PWWF are included in **Attachment 2**.

6 Conclusions and Next Steps

The SewerGEMS model recreation has been validated as an acceptable tool for analyzing flows within EPASD sewer system. Based on the calibration and validation efforts, the model is now ready for more detailed analysis and future planning. The next steps in the process include:

1. Updating the GIS map file to reflect the most current As-Built data for the 2025 sanitary sewer system.
2. Recalibrating the hydraulic model under the following scenarios:
    a. **2025 Conditions:** Incorporating flow injections from the latest developments based on As-Built data to identify potential system issues or deficiencies.
    b. **2035 Conditions:** Adding flow injections from the East Palo Alto 2035 General Plan and Ravenswood Specific Planto identify necessary system upgrades to accommodate future growth.
    c. **2035 Enhanced Conditions:** Adding flow injections from the 2035 General Plan, Ravenswood Specific Plan, and approved planned developments to identify infrastructure needs for future development.
3. Updating EPASD's Master Plan to incorporate the results of the updated calibration and system analysis.

The next steps described above will ensure the model remains accurate and relevant for both current and future sewer system management.

Notes
(1) Assessor Parcel Number (APNs) for all parcels is provided and street addresses are included when the parcel has an assigned address.
If no address is available, the cell is left blank.
(2) 2014 zoning is the zoning for the parcel at the time of the preparation of the 2015 Master Plan for the East Palo Alto Sanitary District.
(3) 2035 Zoning per the City of East Palo Alto's General Plan.

Appendix C: Table 2
2014 Zoning Sanitary Sewer Flows

APN (1)		Address (1)	Land Use from EDS (2)	Equivalent Dwelling Units (3)	Average Daily Flow for Residential , GPD (4)
113-740-010 to 113-740-999		2470 GLORIA WAY, EAST PALO ALTO	Res-Multpl	9	2,160
114-240-010 to 114-240-300		2330 UNIVERSITY AVE, EAST PALO ALTO	Res-Multpl	30	7,200
114-450-010 to 114-460-300		1765 EAST BAYSHORE RD, EAST PALO ALTO	Res-Multpl	36	8,640
			Total	**1,034**	**248,273**

Notes:

(1) Properties with Zoning change per Figure 4-12: General Plan Land Use and Figure 4-16: Ravenswood / 4 Corners TOP Specific Plan Land Use City of East Palo Alto General Plan "Existing Conditions Report, February 2014" and Figure 4-2: General Plan Land Use Designations City of East Palo Alto General Plan "Vista 2035, Final Version: March 2017"

(2) Land use from EDS (Engineering Data Services) Service Fee Calculation sheet.

(3) Equivalent Dwelling Units. Unit= (Past Billing amount from EDS)/$575

(4) ADWF Equivalent Dwellings, calculated by multiplying 240 gallons per dwelling unit per day by the total number of units. Based on Section B1.03.2.b of the East Palo Alto Sanitary District Standard Specifications for Design and Construction of Sanitary Collection and Conveyance Facilities date June 6, 2002. Units converted from GPD (Gallons Per Day) to CFS. Based Based off 24 hours in a day, 60 minutes in a hour, and 60 seconds in a minute.

(5) Additional parcles added to 2014 conditions per 2025 EPASD Master Plan Appendix D.

Abbreviations

ADWF: Average Dry Weather Flow
APN: Assessors Parcel Number
CFS: Cubic Feet per Second
MGD: Million Gallons Per Day
PDWF: Peak Dry Weather Flow

Notes:
(1) Properties with Zoning change per Figure 4-12: General Plan Land Use and Figure 4-16: Ravenswood / 4 Corners TOP Specific Plan Land Use City of East Palo Alto General Plan "Existing Conditions Report, February 2014" and Figure 4-2: General Plan Land Use Designations City of East Palo Alto General Plan "Vista 2035, Final Version: March 2017"
(2) du/a and FAR based on Section 4 Table 4-2 of City of East Palo Alto General Plan "Vista 2035, Final Version: March 2017"
(3) Square footage of parcel divided 43,560 feet (1 Acre Equivalent).
(4) Average Dwelling units per number of acres in parcel is calculated to be 50% of the maximum number of units allowed in the General Plan.
(5) Calculated by multiplying 50% of the maximum FAR for the land use allowed by the General Plan and square feet of parcel.
(6) 2025 Master Plan update ADWF Residential Dwellings, calculated by multiplying 200 gallons per dwelling unit per day by the total number of untis.
(7) ADWF Non-Residential , calculated by multiplying 0.1 gallons per day per square foot. Based on Section B1.03.3 for Office and Retail of the East Palo Alto Sanitary District Standard Specifications for Design and Construction of Sanitray Collection and Conveyance Facilities dated June 6, 2002. Units converted from GPD (Gallons Per Day) to CFS assuming flows are discharged over 24 hours in a day.
(8) Number of units planned are approved development projects by the City. Average Daily Flow, Residential is calculated using the known unit count.

Abbreviations
ADWF: Average Dry Weather Flow
APN: Assessors Parcel Number
CFS: Cubic Feet per Second

Notes are on Page 2 of 2.

Appendix C: Table 4
Scenario 2: 2025 Additional Sanitary Sewer Flows

Notes:

(1) Properties with Zoning change per Figure 4-12: General Plan Land Use and Figure 4-16: Ravenswood / 4 Corners TOP Specific Plan Land Use City of East Palo Alto General Plan "Existing Conditions Report, February 2014" and Figure 4-2: General Plan Land Use Designations City of East Palo Alto General Plan "Vista 2035, Final Version: March 2017"

(2) Per Section 5.3.2 of the "East Palo Alto Sanitary District Master Plan Update, March 2015". For modeling scenarios, peak sanitary flows based on the collected data. Collected data for Peaking Factors for each sub-basin are shown in Table 3.2.

(3) Delta Residential Flows is calculated by taking the Average Daily Flow for Residential areas from Table 3 minus the Average Daily Flow for Residential area from Table 2. If calculation resulted in a decrease of flow, the flow change is shown as "0" because it is not anticipated that the land use changes will result in flow reductions.

(4) Delta Non-Residential Flows is calculated by taking the Average Faily Flow for Non-Residential areas from Table 3 minus the Average Daily Flow for Non-Residential areas from Table 2.

(5) ADWF Residential Dwellings, calculated by multiplying 200 gallons per dwelling unit per day by the total number of units. Based on internal F&L meeting, 2/13/2025. Units converted from GPD (Gallons Per Day) to CFS based off 24 hours in a day, 60 minutes in a hour, and 60 seconds in a minute.

(6) ADWF Non-Residential , calculated by multiplying 0.1 gallons per day per square foot. Based on Section B1.03.3 for Office and Retail of the East Palo Alto Sanitary District Standard Specifications forDesign and Construction of Sanitray Collection and Conveyance Facilities dated June 6, 2002. Units converted from GPD (Gallons Per Day) to CFS. Based off 24 hours in a day, 60 minutes in an hour, and 60 seconds in a minute.

(7) PDWF Residential Dwellings, calculated by multiplying Average Dry Weather Flows (5) by the Peaking Factor (2). Units converted from GPD to CFS. Based off 24 hours a day, 60 minutes in a hour, and 60 seconds in a minute.

(8) PDWF Non-Residential, calculated by multiplying Average Dry Weather Flows (6) by the Peaking Factor (2). Units converted from GPD to CFS. Based off 24 hours a day, 60 minutes in a hour, and 60seconds in a minute.

(9) Number of units planned are approved development projects by the City. Average Daily Flow, Residential is calculated using the known unit count.

Abbreviations

ADWF: Average Dry Weather Flow
APN: Assessors Parcel Number
CFS: Cubic Feet per Second
MGD: Million Gallons Per Day
PDWF: Peak Dry Weather Flow

Notes:

(1) Properties with Zoning change per Figure 4-12: General Plan Land Use and Figure 4-16: Ravenswood / 4 Corners TOP Specific Plan Land Use City of East Palo Alto General Plan "Existing Conditions Report, February 2014" and Figure 4-2: General Plan Land Use Designations City of East Palo Alto General Plan "Vista 2035, Final Version: March 2017"

(2) Per Section 5.3.2 of the "East Palo Alto Sanitary District Master Plan Update, March 2015". For modeling scenarios, peak sanitary flows based on the collected data. Collected data for Peaking Factors for each sub-basin are shown in Table 3.2.

(3) Delta Residential Flows is calculated by taking the Average Daily Flow for Residential areas from Table 3 minus the Average Daily Flow for Residential area from Table 2. If calculation resulted in a decrease of flow, the flow change is shown as "0" because it is not anticipated that the land use changes will result in flow reductions.

(4) Delta Non-Residential Flows is calculated by taking the Average Faily Flow for Non-Residential areas from Table 3 minus the Average Daily Flow for Non-Residential areas from Table 2.

(5) ADWF Residential Dwellings, calculated by multiplying 200 gallons per dwelling unit per day by the total number of units. Based on internal F&L meeting, 2/13/2025. Units converted from GPD (Gallons Per Day) to CFS based off 24 hours in a day, 60 minutes in a hour, and 60 seconds in a minute.

(6) ADWF Non-Residential , calculated by multiplying 0.1 gallons per day per square foot. Based on Section B1.03.3 for Office and Retail of the East Palo Alto Sanitary District Standard Specifications for Design and Construction of Sanitray Collection and Conveyance Facilities dated June 6, 2002. Units converted from GPD (Gallons Per Day) to CFS. Based off 24 hours in a day, 60 minutes in a hour, and 60 seconds in a minute.

(7) PDWF Residential Dwellings, calculated by multiplying Average Dry Weather Flows (5) by the Peaking Factor (2). Units converted from GPD to CFS. Based off 24 hours a day, 60 minutes in a hour, and 60 seconds in a minute.

(8) PDWF Non-Residential, calculated by multiplying Average Dry Weather Flows (6) by the Peaking Factor (2). Units converted from GPD to CFS. Based off 24 hours a day, 60 minutes in a hour, and 60 seconds in a minute.

(9) Number of units planned are approved development projects by the City. Average Daily Flow, Residential is calculated using the known unit count.

Abbreviations

ADWF: Average Dry Weather Flow
APN: Assessors Parcel Number
CFS: Cubic Feet per Second
MGD: Million Gallons Per Day
PDWF: Peak Dry Weather Flow

Notes:

(1) Properties that have changed Zoning Figure 4-12: General Plan Land Use and Figure 4-16: Ravenswood / 4 Corners TOP Specific Plan Land Use City of East Palo Alto General Plan "Existing Conditions Report, February 2014" Vs Figure 4-2: General Plan Land Use Designations City of East Palo Alto General Plan "Vista 2035, Final Version: March 2017"

(2) Per Section 5.3.2 of the "East Palo Alto Sanitary District Master Plan Update, March 2015". For modeling scenarios, peak sanitary flows based on the collected data. Collected data for Peaking Factors for each sub-basin are shown in Table 2.

(3) Delta Residential Flows is calculated by taking the Average Daily Flow for Residential areas from Table 3 minus the Average Daily Flow for Residential area from Table 2. If calculation resulted in a decrease of flow, the flow change is shown as "0" because it is not anticipated that the land use changes will result in flow reductions.

(4) Delta Non-Residential Flows is calculated by taking the Average Faily Flow for Non-Residential areas from Table 3 minus the Average Daily Flow for Non-Residential areas from Table 2.

(5) ADWF Residential Dwellings, calculated by multiplying 200 gallons per dwelling unit per day by the total number of units. Based on internal F&L meeting, 2/13/2025. Units converted from GPD (Gallons Per Day) to CFS based off 24 hours in a day, 60 minutes in a hour, and 60 seconds in a minute.

(6) ADWF Non-Residential , calculated by multiplying 0.1 gallons per day per square foot. Based on Section B1.03.3 for Office and Retail of the East Palo Alto Sanitary District Standard Specifications for Design and Construction of Sanitray Collection and Conveyance Facilities dated June 6, 2002. Units converted from GPD (Gallons Per Day) to CFS. Based off 24 hours in a day, 60 minutes in a hour, and 60 seconds in a minute.

(7) PDWF Residential Dwellings, calculated by multiplying Average Dry Weather Flows (5) by the Peaking Factor (2). Units converted from GPD to CFS. Based off 24 hours a day, 60 minutes in a hour, and 60 seconds in a minute.

(8) PDWF Non-Residential, calculated by multiplying Average Dry Weather Flows (6) by the Peaking Factor (2). Units converted from GPD to CFS. Based off 24 hours a day, 60 minutes in a hour, and 60 seconds in a minute.

(9) Number of units planned are approved development projects by the City. Average Daily Flow, Residential is calculated using the known unit count.

Abbreviations

ADWF: Average Dry Weather Flow
APN: Assessors Parcel Number
CFS: Cubic Feet per Second
MGD: Million Gallons Per Day
PDWF: Peak Dry Weather Flow

Appendix C: Table 7

114-590-050		NO DATA, EAST PALO ALTO	Office	0	0.0363	0.0545
				Total (CFS)	**2.84**	**4.47**
				Total (MGD) (3)	**1.85**	**2.90**

Notes:
(1) Increase in ADWF and PDWF is the difference between the estimated flows from 2014 presented in Table 2 and the projected flows based on the Vision 2035 General Plan Update presented in Table 3.
(2) ADWF and PDWF assumes that flows are contributed from all land uses over a standard 24-hour day.
(3) Total ADWF Increase in MGD is consistent with the projected increase in water demand in the Year 2040 presented in Section 3 of the City of East Palo Alto's 2015 Urban Water Management Plan date Ju 2016.The City of East Palo Alto water supply allocation from the San Francisco Public Utilities Commission was 1.96 MGD and the General Plan projects a maximum demand of 3.03 MGD in the Year 2040 representing an increase of 1.07 MGD in average day demand.
(4) Flows from parcels based on New Service Applications submitted to the District. Please see Table 6 for calculation of injected flows.

Abbreviations
ADWF: Average Dry Weather Flow
APN: Assessors Parcel Number
CFS: Cubic Feet per Second
MGD: Million Gallons Per Day
PDWF: Peak Dry Weather Flow

CIP PROJECT SUMMARY SHEETS

Appendix E
Capital Improvement Project 1.1
Conceptual OPPC
2025 Sewer System Master Plan
East Palo Alto, California

Project Description: Pipeline Replacement on Menalto Avenue, Poplar Avenue, Bay Road, and Elliot Drive.

Item No.	Description	Units	Quantity	Unit Price	Budget
Conceptual Opinion of Probable Construction Cost					
1	Mobilization	%	5%	$ 2,488,000	$ 124,400
2	Traffic Control	%	15%	$ 2,488,000	$ 373,200
3	Sheeting, Shoring, and Bracing	%	5%	$ 2,488,000	$ 124,400
4	8-inch DR 17 HDPE Pipe	lf	950	$ 400	$ 380,000
5	10-inch DR 17 HDPE Pipe	lf	2,218	$ 500	$ 1,109,000
6	12-inch DR 17 HDPE Pipe	lf	1,665	$ 600	$ 999,000
7	Manholes	ea	19	$ 11,000	$ 209,000
8	30% Contingency	%	30%	$ 3,319,000	$ 995,700
Subtotal - Conceptual Opinion of Probable Construction Cost (3)					**$ 4,315,000**
Engineering and Administration Cost					
9	Design	%	10%	$ 4,315,000	$ 432,000
10	Environmental/Permitting	%	10%	$ 4,315,000	$ 432,000
11	Construction Management/Inspection	%	15%	$ 4,315,000	$ 647,000
12	District Administration	%	5%	$ 4,315,000	$ 216,000
Subtotal - Engineering and Administration Cost (3)					**$ 1,727,000**
Total Conceptual Opinion of Probable Project Cost (3)					**$ 6,042,000**

Notes
(1) Projects will need Encroachment Permit with City of Menlo Park. Project will involve crossing Bayshore Freeway.
(2) See Figure A for limits of improvement
(3) Costs rounded to nearest $1,000.

Abbreviations
DR: dimension ration
HDPE: high density polyethylene
OPPC: opinion of probable project cost

Appendix E
Capital Improvement Project 1.2
Conceptual OPPC
2025 Sewer System Master Plan
East Palo Alto, California

Project Description: Pipeline Replacement on Trunk Line in Creek, Beech Street, Larkspur, and Gardenia Ave.

Item No.	Description	Units	Quantity	Unit Price	Budget
Conceptual Opinion of Probable Construction Cost					
1	Mobilization	%	5%	$ 4,294,200	$ 214,710
2	Traffic Control	%	15%	$ 4,294,200	$ 644,130
3	Sheeting, Shoring, and Bracing	%	5%	$ 4,294,200	$ 214,710
4	8-inch DR 17 HDPE Pipe	lf	272	$ 400	$ 108,801
5	12-inch DR 17 HDPE Pipe	lf	179	$ 600	$ 107,241
6	16-inch DR 17 HDPE Pipe	lf	533	$ 900	$ 480,091
7	30-inch DR 17 HDPE Pipe	lf	1,684	$ 2,550	$ 4,294,200
8	Manholes	ea	14	$ 11,000	$ 154,000
9	30% Contingency	%	30%	$ 6,217,882	$ 1,865,365
Subtotal - Conceptual Opinion of Probable Construction Cost (3)					**$ 8,083,000**
Engineering and Administration Cost					
10	Design	%	10%	$ 8,083,000	$ 808,000
11	Environmental/Permitting	%	10%	$ 8,083,000	$ 808,000
12	Construction Management/Inspection	%	15%	$ 8,083,000	$ 1,212,000
13	District Administration	%	5%	$ 8,083,000	$ 404,000
Subtotal - Engineering and Administration Cost (3)					**$ 3,232,000**
Total Conceptual Opinion of Probable Project Cost (3)					**$ 11,315,000**

Notes
(1) Environmental Permits will be required. Trunk Line improvements are located on Creek. Coordination will be required for PG&E gas line.
(2) See Figure A for limits of improvement
(3) Costs rounded to nearest $1,000.

IMPACT FEE MEMORANDUM

Impact Fee Memorandum

Re:	East Palo Alto – Sewer Fee Determination
Date:	June 20 2025
To:	Richard Perez, City of East Palo Alto
	Humza Javed, P.E. City of East Palo Alto
From:	Greg Arifian P.E., Freyer & Laureta, Inc.
	Rheanna Ostrea, Freyer & Laureta, Inc.
	Zoe Gnass, Freyer & Laureta, Inc.
Reviewed:	Jeffrey Tarantino, P.E., Freyer & Laureta, Inc.

1 Introduction

Freyer and Laureta, Inc. (F&L) has prepared this memorandum to outline the proposed Sanitary Sewer Capital Improvement Program (CIP) identified in the 2025 Sewer System Master Plan for the East Palo Alto Sanitary District's (EPASD). The memorandum serves as a comprehensive guide to address existing infrastructure deficiencies and accommodate future development needs.

The memorandum discusses the following information:

- Improvements needed to improve the overall reliability and resiliency of the existing sanitary sewer collection system.
- Improvements needed necessary to support future development as approved by the City of East Palo Alto (City).
- Proportional allocation of improvements costs between existing and future customers.
- Development of an impact fee for new developments requiring sanitary sewer service.
- CIPs identified within the 2025 Sewer System Master Plan (2025 Master Plan)
- Potential cash flow scenarios for each CIP alternative to evaluate potential adjustments to the Annual Sewer Charge (ASC), which may be required and subject to a future and separate Proposition 218 process.

The analysis shows that the costs for existing customers are based on the repair and replacement costs of the existing system while the developers will pay the costs for expanding the sewer system to accommodate new development. The CIP projects identified for existing infrastructure will be repaired or maintained by a combination of public financing, existing ratepayers, and new developments.

2 2025 Master Plan Analysis

The 2025 Master Plan involved hydraulic modeling and condition assessments to recommend improvements addressing identified system deficiencies. Improvements were categorized into four groups to develop the CIP projects based on the type of deficiency:

- Category 1 - Existing Pipe Capacity Deficiencies: Improvements to address current hydraulic capacity deficiencies under present-day flow conditions. Approximately 7,285 linear feet (LF) of pipe require upsizing to meet the minimum four-foot freeboard criteria for surcharging under Peak Wet Weather Flow (PWWF).

- Category 2 - Future Pipe Capacity Deficiencies: Improvements to address projected capacity constraints due to future growth and development. Approximately 13,848 LF of pipe must be upsized under PWWF to accommodate anticipated increases in flow.

- Category 3 - Pipe Structural Deficiencies: Improvements to address physical structural defects identified through closed-circuit television (CCTV) inspections. Approximately 9,796 LF of pipes are identified as structurally deficient and prioritized for replacement.

- Category 4 - Remaining Sewer System: Improvements to address the remaining pipes within the collection system. Approximately 142,928 LF of pipe is recommended for phased replacement over a 20-year planning period to ensure long-term serviceability.

3 Impact Fee – Calculation Methodology

3.1 Developer's Share of Capacity Assurance

An evaluation of hydraulic capacity improvements from Category 1 and Category 2 was conducted to determine the proportionate cost responsibility for new development. The capacity assessment identified shared infrastructure upgrades that benefit both existing and future users. The analysis was performed based on pipe sizing requirements and projected flow contributions.

3.1.1 Category 1: Existing Capacity Improvements

A portion of Category 1 improvements were identified as shared infrastructure upgrades that benefit both existing and future users. The analysis for proportionate cost responsibility was compared to the overall cost for Category 1 CIP projects. The total estimated cost for Category 1 CIP projects is approximately $17.7 million. The list of Category 1 pipes to be improved is listed in **Table 1** and the Conceptual Opinion of Probable Project Cost (OPPC) is in **Table 2.**

Approximately 1,684 linear feet (LF) of pipeline improvements identified in Category 1 were determined to serve both existing and future capacity needs and the shared benefit segments are illustrated in **Figure 1**.

3.1.2 Beech Street Improvements

The Beech Street segment shown in Figure 1 requires different pipe sizes under existing and future scenarios. For existing capacity improvements under Category 1, the proposed pipe diameter is 24-inch HDPE while future development under Category 2 necessitates an increase to 30-inch HDPE. A planning-level OPPC was prepared for both diameters, with the cost difference attributed to the upsizing totaling approximately $524,000. The differential cost between Category 1 and Category 2 improvements represents the portion of the improvement cost assignable to future development. The cost breakdown is presented in **Table 3**.

3.1.3 Trunk Line Improvements

In contrast, the trunk line improvements require the same pipe size under both existing and future scenarios. Therefore, a flow-based cost allocation method was used. The system currently has an existing average dry weather flow (ADWF) capacity of approximately 1.56 million gallons per day (MGD). Future development is projected to increase flows by an equivalent amount, 1.84 MGD, which approximately increases the total flow within the system by more than half. As a result, the cost of the trunk line improvements is allocated equally (50/50) between existing and future customers.

The total OPPC for the trunk line improvements is estimated at $8,440,000, with $4,220,000 assigned to new development. The OPPC for the trunk line improvement is in **Table 4**.

3.1.4 Summary Cost Analysis

Based on both the pipe sizing and flow-based analyses, the portion of Category 1 improvements that benefit new development is estimated to be approximately **25%**. The full cost allocation summary is shown in **Table 5**.

3.2 Developer's Improvement

Category 2 solely focuses on addressing projected capacity constraints driven by future growth and development. As these improvements will be pipe size upgrades driven by developers, the cost of these improvements will be accounted for in the development's connection fees. The total OPC for the trunk line improvements is estimated at $49,046,000. The list of pipes to be upsized is in **Table 6** and the OPC for the Category 2 projects is presented in **Table 7**.

4 Proposed Development Impacts

4.1 Anticipated Developments

The City provided a list of developments planned for the 2025/26 fiscal year. Additionally, the Master Plan identified other planned developments that have been approved or are in planning with City. The known developments have been assumed to be within the 2026/27 and 2027/28 fiscal years. The list, along with the anticipated number of residential units or square feet of commercial, industrial, or office space, is shown in **Table 8**.

Table 9 calculates the Equivalent Dwelling Units (EDUs) that are associated with each the anticipated developments. EPASD utilizes the EDUs to calculate the Impact Fee.

5 Impact Fee

As part of the ongoing development of the Master Plan and identification of new CIP projects, EPASD intends to update its impact fee to accurately reflect the costs associated with planned system improvements and infrastructure expansion. .

This fee has been calculated based on the following cost components:

- Developer's Share of Capacity Assurance: Approximately 25 percent of the costs associated with existing capacity assurance improvements, which are expected to provide benefits to new development.
- Developer's Improvement: 100 percent of the costs related to capacity deficiencies that are directly attributable to new development demands.
- Buy-In Treatment Cost: A buy-in cost of $5 million per 1.0 million gallons per day (MGD) of treatment capacity, representing the proportional reimbursement by developers for the available capacity at the PAWRQCP.

The calculation method used to determine the fee is presented in **Table 10**. The impact fee developed is $7,800. A regular review of the impact fee should be completed to ensure that the impact fee reflects the costs incurred to accommodate City-approved developments.

6 Proposed Operating and Maintenance Plan

The City has contracted with West Bay Sanitary District (WBSD) to operate and maintain the collection system. The collection system will continue to operate in accordance with Statewide SSO Waste Discharge Requirements and RWQCB Sewer System Management Plan guidelines. WBSD and the City has an agreement for the Operation and Maintenance of Sewer Collection System, the annual budget in the 2024/25 fiscal year was $1,724,120. Per email

from Richard Perez on April 24, 2025, the current annual contract is $1,799,152, which is an increase of 4.37% from the previous year. **Table 11** presents the operating expenses for the EPASD collection system.

In addition to the labor costs for operating the collection system, EPASD contributes the operating and capital costs for the Palo Alto (Regional Water Quality Control Plant PARWQCP) as outlined in the existing agreement. In reviewing the *East Palo Alto Sanitary District, 2019 Sewer Rate Study (Rate Study)*, F&L identified that the study included a summary of anticipated treatment operation, capital, and debt service costs. We have summarized the anticipated costs for PARWQCP treatment and capital improvements in **Table 12**.

7 Capital Improvement Projects

The 2025 Master Plan identified recommendations for Capital Improvement Program (CIP) projects, based on the four categories. The CIP projects were developed and grouped primarily according to their pipeline Category. However, in several cases, CIP improvements with different categories will be addressed in the same project due to overlap or immediate proximity. Below is a summary of the project Groups. A summary of the CIP project identified in the 2025 Master Plan can be seen in **Table 13**.

8 Annual Budget Cash Flow

F&L evaluated the year over year cash flow for operations and improvements of the sanitary sewer collection system. **Table 14** presents F&L's cash flow project for five fiscal years beginning with Fiscal Year 2025/26. The cash flow analysis includes the following key items:

- The Annual Sewer Charge (ASC) is set at $660. Per information from EPASD, the service charge is not expected to increase this fiscal year. It is recommended that a five-percent annual escalation be applied to reflect current economic conditions and the anticipated annual repair and replacement program to address the deficiencies identified in the EPASD CCTV TM.
- The proposed impact fee is to be $7,800 per EDU, similar to the ASC, and an annual 5-percent escalation is applied.
- The total number of anticipated new EDUs for each fiscal year is provided based on the information presented in **Table 9**.
- The total number of connected EDUs is also provided, including accounting for new EDUs that were assumed to be added during each fiscal year. The City shall confirm for EPASD the EDUs to be added each fiscal year.
- The beginning reserve fund balance is $23 million as provided by the EPASD.
- Category 4 pipes for the remaining sewer system assets not currently identified as hydraulically or structurally deficient but nearing the end of their expected service life. These pipes are recommended for phased replacement over a 20-year period to maintain system integrity and service reliability.
- Revenues include the ASC, connection fees, property taxes presented in the EPASD Rate Study, ERAF Rebate/Former RDAF presented in the EPASD Rate Study, and interest earned on reserve funds.
- Expenses including labor and other operating expenses for the collection system, Sewer Rehab Improvements to fund annual point repair projects, Category 4 Improvements, PAWRQCP annual treatment costs, EPASD share of existing PARWQCP debt service, EPASD share of project PARWQCP debt service, and EPASD 2011 SRF Loan debt service presented in the EPASD Rate Study.

For each fiscal year, the project expenses are projected revenues are calculated and presented. If expenses in a given fiscal year are greater than the project revenues, the Reserve Funds are used to balance the expenses and revenues. In utilizing portions of the existing Reserve Funds each fiscal year, the existing customers' contributions to the reserves over the prior years are utilized to fund the CIPs for the existing deficiencies.

At the end of the five-year evaluation period, the projected Reserve Fund balance is $2.4 Million. As EPASD receives its revenue payments twice per year as part of the property tax collection, sufficient reserves to fund at least six months of operation are suggested. The cash flow evaluation presented in **Table 14** maintains a minimum of 12-months of Reserve Funds for each given fiscal year.

The cash flow review above will be impacted by the Operating & Maintenance expenses, PARWQCP Treatment Expenses, and projected developments. If additional information on the actual Reserve Fund balance becomes available, the cash flow analysis will be updated.

Total (7) (8)	--	--	**4,584**	**4,930**	**5,521**	**5,609**	**5,729**

Notes

(1) The increase in Equivalent Dwelling Units (EDU) per year are based on the major proposed developments and their anticipated completion fiscal year.

(2) Number of residential units and flows for all other land uses for fiscal year 2022-23 are assumed to be the same as reported the EPASD "Sewer Service Charges Fiscal Year 2020-2021" report dated July 2020. The referenced report listed that there were a total of 38 customers "manually billed" but no flow or EDU information was provided for the 38 manually billed customers to allow inclusion in the development of projected EDUs.

(3) For non-residential land uses, the total number of equivalent EDUs is calculated by multiplying the flows in HCF by 748 gallons per hcf and then dividing by 200 gallons per EDU.

(4) Numbers of EDU are rounded to the nearest whole number.

(5) Both Single-Residential and Multiple-Residential are assumed to be one EDU per unit.

(6) The EDU calculations for Commercial and Industrial land-use categories use the commercial and industrial unit flows found in EPASD's Standard Specs B1.03-3 and B1.03-4.

(7) The EDU calculations use a rate of 200 gallons per day (gpd) per EDU.

(8) The calculated infiltration rate in EPASD's Standard Specs Section B1.03-5 was ignored since infiltration and inflow will be corrected as part of the PWWF improvements presented in Table 1 and improvements will utilized HDPE that will have fused pipe, which has a considerably lower infiltration rate.

Abbreviations

EDU: equivalent dwelling unit
EPASD: East Palo Alto Sanitary District
hcf: hundreds of cubic feet
HDPE: high density polyethylene
PWWF: peak wet weather flow

1. Sewer Service Charges, Fiscal Year 2020-2021 prepared by EPASD dated July 2020.

Table 10
Impact Fee Calculations
Sewer Impact Fee Memorandum
East Palo Alto, California

AT FULL BUILDOUT		
Projected Total ADWF Increase (gpd) (1)		1,560,000
Projected Total EDU Increase (2)		7800
Development Share of Cost of Capacity Assurance (3)	$	4,380,500
Total Cost of Improvements Due to Development (4)	$	49,046,000
Total Cost of Treatment (5)	$	7,800,000
Impact Fee per EDU(6)	**$**	**7,800**

Notes

(1) Projected Total ADWF Increase is from the EPASD 2025 Wastewater Masterplan.

(2) Projected Total EDU Increase was calculated using a rate of 200 gpd/EDU.

(3) The Development Share of the Cost of the Capacity Assurance is 25% of the costs presented in Table 2. The Capacity Assurance project reduce the potential for sanitary sewer overflows during peak wet weather flows that is a current system deficiency. However, implementing the Capacity Assurance project results in adding additional capacity for both average dry weather flow and peak dry weather flow that is a benefit to new development.

(4) See Table 7 for cost of improvements due to development.

(5) Total Cost of Treatment is based on EPASD reported cost of $5 million per 1.0 MGD of treatment capacity. It should be noted that EPASD current 7.96% ownership of the PARWQCP is equivalent to ADWF capacity of 2.9 MGD. The total project ADWF at full buildout is 2.2 MGD based on 200 gpd/EDU and 12,233 EDUs. Therefore, the Total Cost of Treatment presented above is for new development to buy-in to the available treatment capacity.

(6) Impact fee is calculated by dividing the total cost of improvements and treatment by the projected Total EDU increase and rounding to nearest $100.

Abbreviations

ADWF: Average Dry Weather Flow
EDUs: Equivalent Dwelling Units
gpd: gallons per day

East Palo Alto, California

	2024/25	2025/26	2026/27	2027/28	2028/29	2028/29
Cost Escalation		4.37%	4.37%	4.37%	4.37%	4.37%
Proposed Operating & Maintenance Expenses						
WBSD Contractual Amount (1)	$ 1,724,120	$ 1,799,000	$ 1,878,000	$ 1,960,000	$ 2,046,000	$ 2,135,000
EPASD Salaries Wages & Benefits		$ 400,000	$ 417,000	$ 435,000	$ 454,000	$ 474,000
Total Operating & Maintenance Expenses		$ 1,724,120	$ 2,199,000	$ 2,295,000	$ 2,395,000	$ 2,500,000

Notes

2024/25 fiscal year was $1,724,120. Per email from Richard Perez on April 24, 2025, the current annual contract is $1,799,152, which is an increase of 4.37% from the previous year. The same annual cost escalation of 4.37% is applied in each subsequent fiscal year following Fiscal Year 2024/25.
(2) Costs rounded to nearest $1,000.

PARWQCP Treatment Expenses Calculation (1)
Sewer Impact Fee Memorandum
East Palo Alto, California

	2025/26	2026/27	2027/28	2028/29	2029/30
EPASD Share of PARWQCP (2)	7.64%	7.64%	7.64%	7.64%	7.64%
PARWQCP CAPITAL IMPROVEMENTS (3)					
Existing Debt Service	$ 128,000	$ 128,000	$ 128,000	$ 128,000	$ 128,000
Planned Debt Serve	$ 517,000	$ 517,000	$ 517,000	$ 517,000	$ 517,000
Total EPASD Share of Capital Improvements	**$ 645,000**	**$ 645,000**	**$ 645,000**	**$ 645,000**	**$ 645,000**
PARWQCP OPERATING EXPENSES (3)					
Treatment O&M	$ 2,412,000	$ 2,470,000	$ 2,546,000	$ 2,624,000	$ 2,703,000
Minor CIP Fund	$ 253,000	$ 26,000	$ 267,000	$ 274,000	$ 281,000
Total EPASD Share of Operating Expenses	**$ 2,665,000**	**$ 2,496,000**	**$ 2,813,000**	**$ 2,898,000**	**$ 2,984,000**
Total EPASD Share of Treatment Expenses	**$ 3,310,000**	**$ 3,141,000**	**$ 3,458,000**	**$ 3,543,000**	**$ 3,629,000**

Notes

(1) EPASD does not currently utilize its full 7.64% allocation of treatment capacity and therefore the annual PARWQCB operating costs do not reflect EPASD's full utilization of its capacity. As more EPASD EDUs are connected to the system, the annual rate adjustment is calculated by the proportionate increase in Total EPASD Connected EDUs to reflect the anticipated increase operating expenses.

(2) EPASD share of operating and capital expenses is from the PARWQCP Capital Program Finance Committee Meeting presentation dated 11/17/20, on page 10.

(3) All costs from Table 3 of the EPASD 2019 Sewer Capacity Rate Study dated April 17, 2019.

Abbreviations

EPASD: East Palo Alto Sanitary District
PARWQCP: Palo Alto Regional Water Quality Control Plant
EDUs: Equivalent Dwelling Units

Table 13
Overall – Proposed Capital Improvement Plan
Sewer Impact Fee Memorandum
East Palo Alto, California

Project #	Improvement Category Type (1)			Improvement Description	Proposed Pipe Sizes	Proposed Development (If applicable)	Project Priority	Approximate Length of Pipe (LF)	Projected OPPC ($)	Notes
1.1	1		3	Pipeline Replacement on Menalto Avenue, Poplar Avenue, Bay Road, and Elliot Drive	8-inch, 10-inch, 12-inch HDPE DR 17			4,833	$ 6,042,000	Projects will need Encroachment Permit with City of Menlo Park. Project will involve crossing Bayshore Freeway.
1.2	1			Pipeline Replacement on Trunk Line in Creek and Beech Street	30-inch HDPE DR 17			1,684	$ 9,910,000	Environmental Permits will be required. Trunk Line improvements are located on Creek.
1.3	1		3	Pipeline Replacement on Larkspur Drive and Gardenia Ave	8-inch, 12-inch, 16-inch HDPE DR 17			984	$ 1,724,000	Project will require coordination with PG&E for gas line.
2.0		2		11 Smart Cover Meters to be installed. Per V&A study in 2013, there were 11 sub-catch basin areas.	-			-	$ 134,000	Project will reinstate City's Flow Monitoring Program.
2.1	1	2	3	Pipeline Replacement on Bayshore Road, Donohoe Street, Cooley Ave, and O'Connor Street	8-inch, 10-inch, 12-inch, 24-inch HDPE DR 17	Woodland Parks (2001 Manhattan) & 2120-60 Euclid Avenue	See Note 2	3,460	$ 7,466,000	Project will involve crossing Bayshore Freeway. Project should be continued to be re-evaluated as structural deficiencies may be moved to a higher priority project if proposed development projects are not constructed soon.
2.2	1	2		Pipeline Replacement on University Avenue, Runnymede Street, Clarke Avenue, and Beech Street	10-inch, 12-inch HDPE DR 17	Woodland Parks (2001 Manhattan) & 2120-60 Euclid Avenue	See Note 2	4,188	$ 9,795,000	Project will include coordination with PG&E on gas line on Beech Street.
2.3		2		Pipeline Replacement on Trunk Line in Creek	30-inch HDPE DR 17	Ravenswood Area	See Note 2	2,981	$ 17,635,000	Environmental Permits will be required. Trunk Line improvements are located on Creek.
2.4		2	3	Pipeline Replacement on Bay Road and Pulgas Avenue	8-inch, 10-inch, 24-inch, 30-inch HDPE DR 17	2485 Pulgas Avenue (3) 2535 Pulgas Ave (Office) 2519 Pulgas Ave (Office) 1804 Bay Road 1675 Bay Road	See Note 2	2,799	$ 9,293,000	Project should be continued to be re-evaluated as structural deficiencies may be moved to a higher priority project if proposed development projects are not constructed soon.
2.5		2		Pipeline Replacement on Maple Lane	10-inch HDPE DR 17	Mid-Pen Housing (965 Weeks Street) (3)	See Note 2	1,161	$ 1,401,000	
2.6		2		Pipeline Replacement on O'Connor Street	12-inchHDPE DR 17	Light Tree Apartments (East Bayshore Road) (3)	See Note 2	841	$ 1,248,000	Project will require coordination for two 24-inch PG&E Gas Main Transmissions.
2.7		2		New Parallel Trunk Line within San Francisquito Creek on Palo Alto Golf Course	24-inch HDPE DR 17	Ravenswood Area	See Note 2	1,569	$ 5,832,000	Project should be re-evaluated on a yearly basis. As project scope on developments may be reduced/removed.
3.1			3	Pipeline Replacements on Dumbarton Avenue, Palo Verde Way, Lilac Lane, Flen Way, Capitol Avenue, Woodland Avenue, and Bayshore Road	8-inch, 10-inch HDPE DR 17			3,998	$ 4,061,000	
3.2			3	Pipe Replacements on Bay Road, Weeks Street, Garden Street, Clarke Avenue, and Pulgas Avenue	8-inch, 16-inch, 18-inch HDPE DR 17			2,431	$ 3,657,000	

(1) Category 2 projects that have Category 3 Structural Deficient projects should continue to be re-evaluated as the Category 3 pipes may move to a higher priority CIP project depending on development construction and the yearly CIP budget for rehabilitation projects.
(2) Project timeline will be dependent on when the proposed developments are constructed. City to assess every fiscal year.
(3) Developments have already been completed.

Notes
(1) Proposed Annual Sewer Charge is shown as the rate for existing customers and will not increase for 2025/26. Information provied from Rich Perez via emaill on April 4, 2025.
(2) Proposed Connection Fee consists of a share of cost for capacity assurance and developers cost as shown in Table 10.
(3) See Table 9 for the current number of EDUs and estimate for annual increase in EDUs.
(4) Sewer Service Charges is calculated by multiplying Total EDUs by Annual Sewer Service Charge.
(5) Impact Fees is calculated by multiplying Total New EDUs by Impact Fee.
(6) Source of revenues and expenses is Table 4 of the East Palo Alto Sanitary District 2019 Sewer Rate Study prepared by Bartle Wells Associates dated April 17, 2019.
(7) Investment income is interest income on Beginning Fund Reserve.
(8) Operating & Maintenance Expenses are presented in Table 11.
(9) The City Sewer Rehab Improvement is an ongoing annual program to replace pipes that are found to be damaged or at the end of service life but not included Capacity Assurance Improvements or Developer Impact Capacity Improvements.
(10) Capacity Assurance Improvements is an annual expenditure to implement the improvements identified in Table 2 over a 15 year period. The design and construction will be completed in phases beginning in Fiscal Year 2024/25 once new development begins to come on line.
(11) Reserve Fund was stated to be $23 million as of June 30, 2024 per email by Tomohito Oku on April 25, 2025.
